(54) Title: SMART WEARABLE DEVICES AND METHODS FOR ACQUISITION OF SENSORIAL INFORMATION FROM WEARABLE DEVICES TO ACTIVATE FUNCTIONS IN OTHER DEVICES

FIG. 3

(57) Abstract: Smart wearable devices and methods for acquiring sensor data about a user to determine the physical and mental status of the user and automatically activate or deactivate other devices when authenticated by biometric security access specific to the wearer are presented. Specifically, the smart wearable device can automatically acquire a user's biological input, such as heart rate, breathing, body temperature, etc. and based on the input, automatically activate or deactivate a function in another device by sending a triggering signal to the other device.

**(81) Designated States** (unless otherwise indicated, for every kind of national protection available): AE, AG, AL, AM, AO, AT, AU, AZ, BA, BB, BG, BH, BN, BR, BW, BY, BZ, CA, CH, CL, CN, CO, CR, CU, CZ, DE, DK, DM, DO, DZ, EC, EE, EG, ES, FI, GB, GD, GE, GH, GM, GT, HN, HR, HU, ID, IL, IN, IR, IS, JP, KE, KG, KN, KP, KR, KZ, LA, LC, LK, LR, LS, LU, LY, MA, MD, ME, MG, MK, MN, MW, MX, MY, MZ, NA, NG, NI, NO, NZ, OM, PA, PE, PG, PH, PL, PT, QA, RO, RS, RU, RW, SA, SC, SD, SE, SG, SK, SL, SM, ST, SV, SY, TH, TJ, TM, TN, TR, TT, TZ, UA, UG, US, UZ, VC, VN, ZA, ZM, ZW.

**(84) Designated States** (unless otherwise indicated, for every kind of regional protection available): ARIPO (BW, GH, GM, KE, LR, LS, MW, MZ, NA, RW, SD, SL, ST, SZ, TZ, UG, ZM, ZW), Eurasian (AM, AZ, BY, KG, KZ, RU,

TJ, TM), European (AL, AT, BE, BG, CH, CY, CZ, DE, DK, EE, ES, FI, FR, GB, GR, HR, HU, IE, IS, IT, LT, LU, LV, MC, MK, MT, NL, NO, PL, PT, RO, RS, SE, SI, SK, SM, TR), OAPI (BF, BJ, CF, CG, CI, CM, GA, GN, GQ, GW, KM, ML, MR, NE, SN, TD, TG).

The owner of the copyright rights has no objection to the facsimile reproduction by anyone of the patent document or the patent disclosure, as it appears in the United States Patent and Trademark Office publicly available file or records, but otherwise reserves all copyright rights whatsoever. The copyright owner does not hereby waive any of its rights to have this patent document maintained in secrecy, including without limitation its rights pursuant to 37 C.F.R. § 1.14.

25

BACKGROUND

**[0004]** 1. Field of the Technology

**[0005]** This technology pertains generally to smart wearable devices and sensor networks and more particularly to a system of non-wearable and wearable sensor and processing devices that are capable of acquiring sensorial information and activating functions in other devices where the function activation and access to wearable sensor data and to programming

30

are authenticated by a biometric feature of an authorized wearer.

**[0006]** 2. Discussion

**[0007]** The availability of reasonably priced wearable devices means that most wearers will not be limited to the use of only a single device at a given time and many users will be able to wear a number of wearable devices at the same time. Some devices can connect to the Internet or other wireless communications network to transmit and receive data to and from a remote location. Other devices can interconnect with non-wearable devices such as a smart phone or to other wearable devices.

5  
10 **[0008]** However, the transmission of sensitive medical sensor data over wireless communication systems creates privacy and security concerns. Security is an important part of privacy. Therefore, a non-wearable device such as mobile phone may use a pin code or pattern, etc. in order to protect the device from being accessed by unauthorized people. At the same time, it is also important for the users of a wearable device to be able to quickly access the relevant information from the non-wearable device without too much difficulty.

15  
20 **[0009]** Currently, there is no suitable system that allows a user to activate a specific function on a smart device without the user manually instructing the smart device directly. For example, the user of a smart wearable device may have a particular physical or mental health condition that makes it difficult or impossible to manually operate other desired or necessary devices. There is a need for a smart wearable device that is able to monitor the physical and mental status of a user and, where appropriate, automatically activate or deactivate a specific function on other relevant devices.

25  
30 **[0010]** Accordingly, there is a need for smart wearable devices that can automatically sense when a device, such as a non-wearable or media rendering device, is in communication range and automatically verify that a particular device has authorization or access rights to associate with the device. There is also a need for wearable devices and systems that are secure and private that ensure that the availability of sensor data from

wearable and associated wearable and non-wearable devices is under the control of an authorized wearer.

#### BRIEF SUMMARY

5 **[0011]** A secure network of wearable and non-wearable devices and status monitoring methods is provided that authenticates the identity of the user of the smart wearable device using biometrics, such as a user's heart rate signature.

**[0012]** Access authorization between devices may also require authentication of the user. For example, activation or deactivation of other devices may occur only if the user of the wearable device is authenticated using some biometric signature of the user from a wearable device. Sensitive sensor data would not be transferred to another device without the proper biometric authentication. Authentication does not require any affirmative action on the part of the user such as entering a password.

10 **[0013]** In one embodiment, a smart wearable device is provided that includes at least one biological or physiological sensor for acquiring biological input about the user. This input may be acquired through automatically sensing and collecting biological information about the user and may be supplemented with user input or input from other health care providers.

**[0014]** Sensors placed on or around an individual can acquire biological or physical data in real time. Both non-invasive and invasive sensors, alone or collectively, can produce data that can be processed to determine the physical or mental status of the user at an instant or to identify trends over time. Multiple sensors with the capability of collecting biological or physical data (heart rate, blood oxygen and sugar levels, body temperature and etc.) of a user can be applied with the use of wearable devices.

25 **[0015]** Other associated sensors can collect data on the environment including location, altitude, air pollution, pollen count, distance traveled, and external temperature etc. that can be considered within the context of the sensor data obtained from a particular user of sensors of a wearable

device. Information regarding the location and environmental context of the wearer of wearable sensor devices can be relevant to the function of the sensors of each device and the interpretation of the data that is produced by the device sensors. The collection and processing of sensor data from multiple sensors of a wearer can also be accomplished with wired or wireless transmissions.

**[0016]** In one embodiment, the smart wearable device may be programmed to determine the physical and mental status of the user. When a given status is determined from the sensor data, the smart wearable device may automatically generate a triggering signal that can be sent to other devices. The triggering signal may then activate a desired functionality in the other devices.

**[0017]** The device or devices that receive the triggering signal from the smart wearable device may be another smart wearable device, a mobile device, such as a smart phone, a tablet, a lap top computer or desk top computer. Optionally, the device that receives the triggering signal from the smart wearable device can send a return signal to the smart wearable device acknowledging that the initial signal was received and the desired function has been activated or deactivated.

**[0018]** In another embodiment, a computer implemented method for enabling a smart wearable device to automatically generate a triggering signal to activate a certain functionality of another device (wearable or non-wearable) includes using the smart wearable device's biological sensors to collect biological data about the user and then processing this data to determine the physical or mental status of the user. A triggering signal may be generated in response to the physical or mental status determination and the triggering signal may be sent to another device in order to activate a desired function on the other device.

**[0019]** In yet another embodiment, a system is described for automatically activating devices by a smart wearable device to collect physical and mental input about a user, sending a triggering signal that triggers another device to activate a desired function in response to analyzed sensor data.

**[0020]** Another embodiment of the wearable sensor includes environmental sensors that may act in conjunction with the biological sensors to initiate functions in other devices. Also, user input may also be used to cause the smart wearable device to generate the triggering signal.

5 **[0021]** A biometric characteristic of the wearer of the wearable device is used as a security element to authenticate the identity of the wearer and to unlock communications without the manual entry of an authentication code or other conventional security entry. For example, in one embodiment, a biometric sensor that has been placed in a wearable device, such as heart  
10 ID from Bionym or other sensor provider, can be used to secure the identification of wearer.

**[0022]** Without the right heart ID, for example, the data from the wearable device cannot be accessed or transferred. The wearable device will be given the access right to unlock the non-wearable device after these two  
15 devices have been paired through Bluetooth or other communications system.

**[0023]** In another embodiment, a method is provided for a user of a wearable device to obtain quick access to the relevant information based on a notification event from a non-wearable device to the wearable. Using  
20 the authentications of the wearable device to unlock the non-wearable device and the non-wearable device can automatically receive raw sensor data or processed sensor data as well as contextual information, including timing and proximity.

**[0024]** When the non-wearable device receives an incoming event, a notification can be sent to the wearable device through the Bluetooth or  
25 other device communications system. The notification could be a haptic feedback in form of vibrations or heating or cooling elements. The optional notification could also be in the form of a light signal or an audible noise created by the wearable device to alert the wearer of the event.

30 **[0025]** In another embodiment, when the wearer of the wearable device picks up a non-wearable device, the proximity of the non-wearable device to the wearable device will inform the non-wearable that the wearable is in

close range and to initiate a request for communication. The non-wearable device can then let the wearable device unlock the lock of the non-wearable device and receive sensor data from the wearable device. In addition, based on the timing of the notification event that has been sent from the non-wearable device to the wearable device, the sensor information can then be displayed on the non-wearable device to the wearer. The connected non-wearable device can also record, process or transmit the sensor data from the wearable device in this illustration. The authenticated non-wearable device can also program the wearable device in another embodiment.

**[0026]** Further aspects of the technology will be brought out in the following portions of the specification, wherein the detailed description is for the purpose of fully disclosing preferred embodiments of the technology without placing limitations thereon.

#### BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWING(S)

**[0027]** The technology described herein will be more fully understood by reference to the following drawings which are for illustrative purposes only:

**[0028]** FIG. 1 is a schematic diagram of an embodiment of a smart wearable network described herein.

**[0029]** FIG. 2 is a functional block diagram of an embodiment of a smart wearable device described herein.

**[0030]** FIG. 3 is a schematic diagram of an embodiment of a smart wearable device and system that can acquire sensor input and in response send a triggering signal to activate or deactivate other devices.

**[0031]** FIG. 4 is a flow diagram of a method for acquiring sensorial data on a smart wearable device, and in response, activating functions on other devices.

**[0032]** FIG. 5 is a schematic flow diagram processing flow and the data used for one embodiment of an authentication method of the present disclosure.

## DETAILED DESCRIPTION

**[0033]** The present disclosure generally pertains to wearable devices that are capable of, for example, performing an action based on one or more biological or physiological characteristics of the user wearing the device.

5 Using one or more sensors, a processor, and code executable on the processor, a wearable device can be configured to sense and process characteristics that include, but are not limited to, a wearer's physical characteristics such as gender, weight, height, body temperature, skin temperature, heart rate, respiration, blood sugar level, blood glucose level, 10 stress/fatigue, galvanic skin response, ingestion (protein), digestion rate, metabolic rate, blood chemistry, sweat, core and skin temperature, vital signs, eye dryness, tooth decay, gum disease, energy storage, calorie burn rate, mental alertness, cardiac rhythm, sleep patterns, caffeine content, vitamin content, hydration, blood oxygen saturation, blood cortisol level, 15 blood pressure, cholesterol, lactic acid level, body fat, protein level, hormone level, muscle mass, pH, etc. Such conditions may also include, but are not limited to, position (e.g., prone, upright), movement, or physical state (e.g., sleeping, exercising), etc.

**[0034]** A wearable device may include one or more output devices that 20 include, but are not limited to, haptic output devices (e.g., offset motors, electroactive polymers, capacitive voltage generators, Peltier temperature elements, contracting materials, Braille coding actuators), telemetry devices, visual devices, audible devices, and other output devices.

**[0035]** A wearable device may include an artificial intelligence so that the 25 device can learn and adapt to an individual wearer. The device may be configured to accurately discriminate between erroneous (accidental, unintended, etc.) and valid sensory inputs, thereby developing accurate conclusions about a wearer's physical state or characteristics (e.g., the device does not interpret a wearer rolling over in their sleep as the wearer 30 exercising). The device may also include one or more cameras or other visual sensors for facial, user, or other image recognition. A wearable device may also be configured to transmit information to and/or retrieve

information from a wearer's digital health history.

**[0036]** A wearable device may be configured to output information to a user, to another wearable device, to a non-wearable device, or to a network according to the particular features and function of the device.

5 **[0037] A. Generalized System Implementation.**

**[0038]** FIG. 1 illustrates a generalized networked infrastructure (e.g., system) 100 that includes a network 102. The network could, for example, be a local area network or a wide area network such as the Internet. One or more smart wearable devices 104-1 through 104-n according to  
10 embodiments of the technology described herein may be enabled to communicate with the network 102 through a wired or wireless connection 106. Further, one or more of the smart wearable devices may be enabled to communicate with another smart wearable device through the network 102 or by means of a direct wired or wireless connection 108.

15 **[0039]** One or more of the smart wearable devices 104-1 through 104-n also may be enabled to communicate with one or more non-wearable devices 110-1 through 110-n. The non-wearable devices, which are beyond the scope of this disclosure, may be any conventional "smart" device with a processor, associated operating system, and communications  
20 interface. Examples of non-wearable devices include conventional Smartphones, tablet computers, laptop computers, desktop computers, and set top boxes. Any of the non-wearable devices may be of a type enabled to communicate with an external device through a wired or wireless connection. In that case, one or more of the smart wearable devices may  
25 be enabled to communicate with one or more of the non-wearable devices by means of a direct wired or wireless connection 112. Further, one or more of the non-wearable devices may be of a type enabled to communicate with the network 102 through a standard wired or wireless connection 114. In that case, one or more of the smart wearable devices  
30 may be enabled to communicate with one or more of the non-wearable devices through the network 102.

**[0040]** One or more servers 116-1 through 116-n may be provided in a

client-server configuration and connected to the network by means of a wired or wireless connection 118. The servers may include standalone servers, cluster servers, networked servers, or servers connected in an array to function like a large computer. In that case, one or more of the smart wearable devices may be enabled to communicate with one or more of the servers.

**[0041]** FIG. 2 illustrates a generalized embodiment of a smart wearable device according to the technology described herein. It will be appreciated that the embodiment shown may be modified or customized to enable performing the functions described herein. In the exemplary embodiment shown, the smart wearable device includes an "engine" 200 having a processor 202, memory 204, and application software code 206. The processor 202 can be any suitable conventional processor. The memory 204 may include any suitable conventional RAM type memory and/or ROM type memory with associated storage space for storing the application programming code 206.

**[0042]** A conventional wired or wireless communications module 208 (e.g., transmitter or receiver or transceiver) may be included as needed for performing one or more of the functions of the smart wearable device described herein. Examples of wireless communication capabilities that can be provided include, but are not limited to, Bluetooth, Wi-Fi, infrared, cellular, and near field communication. One or more conventional interfaces or controllers 210 may also be provided if needed. Examples of interfaces or controllers include, but are not limited to, analog to digital converters, digital to analog converters, buffers, etc.

**[0043]** The device may include at least one input 212 for a biological or physiological sensor for providing input to the device to perform one or more of the functions described herein. Sensor inputs 214-1 through 214-n for optional sensors may be included as well. These optional input sensors may include, but are not limited to, accelerometers, temperature sensors, altitude sensors, motion sensors, position sensors, and other sensors to perform the function(s) described herein. One or more conventional

interfaces or controllers 216 may be provided if needed for the sensors. Examples of interfaces or controllers include, but are not limited to, analog to digital converters, digital to analog converters, buffers, etc.

5 **[0044]** Additionally, the device may include one or more outputs 218-1 through 218-n to drive one or more output devices (and include those output devices). These output devices may include, but are not limited to, haptic output devices, telemetry devices, visual devices, audible devices, and other output devices to perform the functions described herein. One or more conventional interfaces or controllers 220 may be provided if needed  
10 for the output devices. Examples of interfaces or controllers include, but are not limited to, analog to digital converters, digital to analog converters, buffers, etc.

**[0045]** A user input 222 may be provided according to the functions described herein. The user input may, for example, initiate one or more  
15 functions, terminate one or more functions, or intervene in a running process. The user input can be any conventional input device, including but not limited to, manual switches, touch sensors, magnetic sensors, proximity sensors, etc. One or more conventional interfaces or controllers 224 may be provided if needed for the output devices. Examples of  
20 interfaces or controllers include, but are not limited to, analog to digital converters, digital to analog converters, buffers, etc.

**[0046]** Depending on the function(s) described herein, the engine 200 may also include a feedback loop 226 for machine learning or other adaptive functions. The feedback loop may also provide for device calibration.

25 **[0047]** It will be appreciated that a smart wearable device as described herein would necessarily include a housing or carrier for the above-described components. It will further be appreciated that, as used herein, the term "smart wearable device" means a device that would be worn or otherwise associated with the body of a user and be "connected" to the  
30 user by means of at least one sensor for sensing one or more biological or physiological conditions of the user.

**[0048]** The particular form of the housing or carrier (i.e., wearable platform)

can vary according to choice and suitability for performing the functions described herein. Examples of wearable platforms include, but are not limited to, hand worn devices, finger worn devices, wrist worn devices, head worn devices, arm worn devices, leg worn devices, ankle worn devices, foot worn devices, toe worn devices, watches, eyeglasses, rings, bracelets, necklaces, articles of jewelry, articles of clothing, shoes, hats, contact lenses, gloves, etc.

[0049] It will further be appreciated that the input sensors and output devices may be integrated into the wearable platform, or may be external to the wearable platform, as is desired and/or suitable for the function(s) of the smart wearable device.

[0050] **B. Smart Wearable Devices and Methods for the Acquisition of Sensorial Information to Automatically Activate Functions on Other Devices.**

[0051] Referring now to FIG. 3, a schematic diagram 300 is shown representing an embodiment of a smart wearable device 104-1 and system that allows a user 302 to automatically activate other devices, given a determined physical, mental, environmental, etc. status from acquired sensor data. For security, the wearable device 104-1 may activate another device or transfer data only if the user of the wearable is authenticated using some biometric signature of the user.

[0052] In this illustration, a user 302 is shown wearing a smart wearable device 104-1 on their arm. As shown in FIG. 2, this smart wearable device includes at least one biological (i.e. physiological) sensor 212 which can acquire biological input 304 about the user. Examples of biological input that may be acquired by a biological sensor 212 include, but are not limited to, blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis. The input that is acquired by the one or more biological and other sensors may be supplemented by manually entering input into the smart wearable device

104-1 by the user or the user's caretaker or healthcare professional.

**[0053]** After input 304 is acquired by the smart wearable device 104-1, the physical or mental and environmental, etc. status of user 302 may be determined. In response to a specific status determination, a triggering signal 306 can be automatically generated that can activate or deactivate functions on other devices, including another smart wearable device 104-n or non-wearable devices 106-1, 106-n such as a mobile device, a tablet, a lap top computer or a desk top computer or other non-wearable device. The non-wearable devices 106-1, 106-n may be remotely located and may receive a triggering signal from the wearable smart device 104-1 through a communication network such as the network 102 shown in FIG. 1.

Examples of other smart wearable devices 104-n may include a glasses type device with camera functionality which may receive a triggering signal from the smart wearable device 104-1 instructing the device to activate camera functionality to capture images or video.

**[0054]** In one embodiment, the smart wearable device 104-1 may be equipped and programmed to receive an acknowledgement signal 308 from the other devices 104-n, 106-1, 106-n that have received a triggering signal 306, acknowledging that the triggering signal 306 was indeed received.

**[0055]** FIG. 4 is a block diagram 400 illustrating an exemplary computer implemented method for activating or deactivating a function on a device in response to input received by a smart wearable device. The smart wearable device may acquire input from one or more biological or physiological sensors at block 410. The biological sensors preferably include a sensor that will provide a biometric signature specific to the user.

**[0056]** At block 420 of FIG. 4, the user is authenticated by biometric authentication. One preferred method of biometric authentication is shown in FIG. 5. Access to the data of the wearable sensor, for example, is restricted unless the user is properly authenticated at block 420. User authentication is a prerequisite to the activation of another device.

**[0057]** Optionally, input from additional sensors, such as environmental sensors, may also be acquired at block 470. The smart wearable device

104-1 may then process the acquired input to determine the status of a user's physical or mental state at block 430.

5 [0058] In response to a specific status determination, the smart wearable device may then generate a triggering signal designed to activate or deactivate functions on other associated devices at block 440. The smart wearable device may then send the triggering signal 450 via a communications interface to another device. The sent triggering signal may then activate or deactivate relevant functions on other devices 460 which may be other smart wearable devices or non-wearable devices as described above.

10 [0059] Turning now to FIG. 5, one embodiment 500 of high-level programming for biometric authentication and data transfer between a wearable device and a non-wearable device is shown schematically. In the illustration shown in FIG. 5, a specific biometric and sensor type are selected and the sensor is incorporated in the wearable device 104-1. At least one non-wearable device 106 is also configured to communicate with the wearable device that has been personalized to be worn by a particular user.

15 [0060] When transfer and evaluation of sensor information from the wearable device is desired, for example, the non-wearable device initiates a signal to the wearable device at block 510 to establish a communications link with the wearable device.

20 [0061] The signal is received by the wearable device at block 520 and a preliminary communications link is established between the wearable and non-wearable devices. The wearable device then checks the identity and authorization of the non-wearable device as being authorized to communicate with the wearable device. The user of the wearable device is authenticated by the wearable by obtaining a biometric from the sensors of the wearable device at block 530. The acquired biometric from the sensor is compared with a pre-defined standard biometric identifier or set of identifiers at block 540.

25 [0062] If the user is not authenticated at decision block 540, because the

biometric identifiers do not match, the communications link between the wearable device and the non-wearable device or devices is disconnected at block 550. If the user is authenticated at decision block 540, the data and authorization to view new or existing sensor data obtained for the wearer on the wearable device is transmitted to the non-wearable device at block 560, for example.

5  
[0063] In one embodiment, the initiation request at block 520, the authentication process at block 530, the link disconnect at block 550 and the authorization transmission at block 560 can each be accompanied by a specific haptic, audible or other notification to the wearer of the wearable device. Vibrations, buzzes, chirps or lights can alert the wearer corresponding specific events.

10  
[0064] The non-wearable device receives the authentication signal that was sent from the wearable at block 560 and unlocks the non-wearable device at block 570. The unlocked non-wearable device can then receive raw data, processed data or other communications or instructions from the wearable device at block 580.

15  
[0065] The received data can also be processed and displayed on the non-wearable device at block 590. Reports, graphs, tables or other compiled data can also be displayed to observe trends or variances at block 590 as well.

20  
[0066] The raw or processed sensor data and other information obtained from the wearable device can be transferred from the non-wearable device to remote locations or to the cloud for storage or review at block 600. For example, processed medical sensor data can be transmitted directly or through the cloud and made part of medical records of the authenticated wearer at a remote location.

25  
[0067] In another embodiment, the authenticated connection between the wearable device and the non-wearable device can be used for programming the wearable device at block 610. The non-wearable device can be used as an interface to introduce new code 206 or to turn wearable sensors on or off or to calibrate the sensors of the wearable device. This  
30

process is user specific and changes to the programming of the wearer device can only take place when a specific user is identified and avoids the situation where sensor changes are made or private data is transferred to an unauthorized user of either the wearable or non-wearable devices.

5 **[0068]** It can be seen that the system for secure quick access to raw or processed sensor data can be adapted to many different circumstances. For example, in one setting the smart wearable device can be attached to the user's body when the device is in use and the smart wearable device continuously monitors the bio-physiological condition of the wearer and may  
10 continuously acquire sensorial information. As a result, the smart wearable device may detect the presence of adverse health conditions or may also detect predetermined health conditions such as heart rate, high stress level, phase of sleep, level of appetite, etc. The smart wearable device may then react automatically to the detection of the health condition by sending a  
15 notification to contact a physician or take a certain medication.

**[0069]** In another implementation, the user of the smart wearable device can specifically configure the device to automatically send a triggering signal to activate or deactivate desired functions on other devices, in response to detection of a predetermined health condition. As an  
20 illustrative example, a user of the smart wearable device may also be wearing a pair of glasses that include a camera function. If the user should have an allergic reaction without realizing what has caused it, the smart wearable device, which could be monitoring his or her bio-physiological condition, could detect the allergic reaction, could automatically send a  
25 triggering signal to the camera on the glasses to activate the camera on the glasses to start recording the current environment of the user. This recording could then be used by a healthcare provider to determine what may have caused the user's allergic reaction.

**[0070]** Another example implementation includes a smart wearable device  
30 that can detect a high stress level for a particular user. In response to the specific determined stress level status, the smart wearable device may generate and send a triggering signal to an audio device, activating the

device to play a particular piece of music or the smart wearable device may signal the lights to dim or the smart wearable device may set a notification to schedule a massage, etc. Alternatively, in response to such a status determination, the smart wearable device may disable certain  
5 predetermined notifications, such as those occurring on a user's smart phone.

**[0071]** Similarly, the stress level of a police officer can be continuously or regularly sensed by a wearable device. If the stress level exceeds a threshold level (e.g., during traffic stop, confronting a potential suspect) the  
10 dashboard camera of the police cruiser is turned on automatically. A camera on the uniform of the police officer can also be turned on automatically any time the stress level exceeds a threshold when something out of the ordinary is happening to the officer. In addition, other external devices or systems can also be activated in the alternative or in  
15 addition to the cameras. For example, an alert can be sent to the dispatch center (or officer's command center, etc) to notify other patrol cars in the vicinity to provide back up or to be on the alert for potential developments where the officer is in need of assistance.

**[0072]** In another implementation, elderly or physically challenged  
20 individuals can be monitored by the use of wearable devices. For example, the user could be living alone or in an area where there is no human supervision. If user stress is sensed and the stress level exceeds a threshold, then the call center is alerted to send help or to intervene (call user to check in) or some other action. Similarly, if accelerometer sensor  
25 input can sense that the user is lying down and other sensors determine that that the stress level is high, then the call center (or other medical service provider) can be automatically notified to investigate.

**[0073]** Embodiments of the present technology may be described with reference to flowchart illustrations of methods and systems according to  
30 embodiments of the technology, and/or algorithms, formulae, or other computational depictions, which may also be implemented as computer program products. In this regard, each block or step of a flowchart, and

combinations of blocks (and/or steps) in a flowchart, algorithm, formula, or computational depiction can be implemented by various means, such as hardware, firmware, and/or software including one or more computer program instructions embodied in computer-readable program code logic.

5 As will be appreciated, any such computer program instructions may be loaded onto a computer, including without limitation a general purpose computer or special purpose computer, or other programmable processing apparatus to produce a machine, such that the computer program instructions which execute on the computer or other programmable  
10 processing apparatus create means for implementing the functions specified in the block(s) of the flowchart(s).

**[0074]** Accordingly, blocks of the flowcharts, algorithms, formulae, or computational depictions support combinations of means for performing the specified functions, combinations of steps for performing the specified  
15 functions, and computer program instructions, such as embodied in computer-readable program code logic means, for performing the specified functions. It will also be understood that each block of the flowchart illustrations, algorithms, formulae, or computational depictions and combinations thereof described herein, can be implemented by special  
20 purpose hardware-based computer systems which perform the specified functions or steps, or combinations of special purpose hardware and computer-readable program code logic means.

**[0075]** Furthermore, these computer program instructions, such as embodied in computer-readable program code logic, may also be stored in  
25 a computer-readable memory that can direct a computer or other programmable processing apparatus to function in a particular manner, such that the instructions stored in the computer-readable memory produce an article of manufacture including instruction means which implement the function specified in the block(s) of the flowchart(s). The computer program  
30 instructions may also be loaded onto a computer or other programmable processing apparatus to cause a series of operational steps to be performed on the computer or other programmable processing apparatus to

produce a computer-implemented process such that the instructions which execute on the computer or other programmable processing apparatus provide steps for implementing the functions specified in the block(s) of the flowchart(s), algorithm(s), formula(e), or computational depiction(s).

5    **[0076]**       It will further be appreciated that "programming" as used herein refers to one or more instructions that can be executed by a processor to perform a function as described herein. The programming can be embodied in software, in firmware, or in a combination of software and firmware. The programming can be stored local to the device in non-  
10   transitory media, or can be stored remotely such as on a server, or all or a portion of the programming can be stored locally and remotely. Programming stored remotely can be downloaded (pushed) to the device by user initiation, or automatically based on one or more factors, such as, for example, location, a timing event, detection of an object, detection of a  
15   facial expression, detection of location, detection of a change in location, or other factors. It will further be appreciated that as used herein, that the terms processor, central processing unit (CPU), and computer are used synonymously to denote a device capable of executing the programming and communication with input/output interfaces and/or peripheral devices.

20   **[0077]**       From the discussion above it will be appreciated that the technology can be embodied in various ways, including but not limited to the following:

**[0078]**       1. A smart wearable device, the device comprising: (a) one or more sensors, wherein at least one sensor is a biological sensor configured to acquire biological input; (b) a memory; (c) one or more communications  
25   interfaces; (d) a processor; and (e) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to: (i) determine a physical or mental status of a user from input acquired by the one or more sensors, wherein at least one sensor is a biological sensor; (ii) in response  
30   to a specific physical or mental status determination, automatically generate a triggering signal to activate or deactivate a function of another device; and (iii) send the triggering signal to the other device.

**[0079]** 2. The device of any preceding embodiment, wherein the other device is a device selected from the group of devices consisting of a wearable smart device, a mobile device, a tablet, a lap top computer and a desk top computer.

5 **[0080]** 3. The device of any preceding embodiment, wherein said programming is further configured to receive a signal from the other device acknowledging the triggering signal was received by the other device.

**[0081]** 4. The device of any preceding embodiment, wherein the one or more communications interfaces are selected from the group consisting of  
10 a wired communications interface, a wireless communications interface, a cellular communications interface, a WiFi communications interface, a near field communications interface, an infrared communications interface, and a Bluetooth communications interface.

**[0082]** 5. The device of any preceding embodiment, wherein the physical or  
15 mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

20 **[0083]** 6. The device of any preceding embodiment, further comprising programming residing in the non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to: (a) determine an environmental status of a user from the input acquired by one or more environmental sensors configured to acquire  
25 contextual input; (b) in response to the environmental status determination, automatically generate a triggering signal to activate a function of another device; and (c) send the triggering signal to the other device.

**[0084]** 7. A computer implemented method for enabling a smart wearable device to automatically generate a triggering signal to active a certain  
30 functionality of another device, the method comprising:(a) providing a smart wearable device, wherein the smart wearable device comprises: (i) one or more sensors, wherein at least one sensor is a biological sensor configured

to acquire biological input; (ii) a memory; (iii) one or more communications interfaces; and (iv) a processor; (b) acquiring biological input from one or more biological sensors; (c) processing the acquired biological input to determine a physical or mental status of the user; (d) responding to a specific determined physical or mental status of the user by automatically generating a triggering signal to activate a function of another device; and (e) sending the triggering signal to the other device using a communications interface; (f) wherein said method is performed by executing programming on at least one computer processor, said programming residing on a non-transitory medium readable by the computer processor.

5  
10  
**[0085]** 8. The method of any preceding embodiment, wherein the other device is a device selected from the group of devices consisting of a wearable smart device, a mobile device, a tablet, a lap top computer and a desk top computer.

15 **[0086]** 9. The method of any preceding embodiment, further comprising receiving a signal from the other device acknowledging the triggering signal was received by the other device.

20 **[0087]** 10. The method of any preceding embodiment, wherein the one or more communications interfaces are selected from the group consisting of a wired communications interface, a wireless communications interface, a cellular communications interface, a WiFi communications interface, a near field communications interface, an infrared communications interface, and a Bluetooth communications interface.

25 **[0088]** 11. The method of any preceding embodiment, wherein the physical or mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

30 **[0089]** 12. The method of any preceding embodiment, further comprising:  
(a) acquiring environmental input from one or more environmental sensors;  
(b) processing the acquired environmental input to determine an

environmental status of the user; (c) responding to the determined environmental status of the user by automatically generating a triggering signal to activate a function of another device; and (d) sending the triggering signal to the other device using a communications interface.

5    **[0090]**        13. A system for automatically generating a triggering signal by a smart wearable device to active a certain functionality of another device, the system comprising: (a) a first smart device, wherein said first smart device is wearable or non-wearable and wherein said first smart device comprises: (i) one or more sensors; (ii) a memory; (iii) one or more  
10   communications interfaces; (iv) a processor; and (v) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to receive and send signals; (b) a second smart device, wherein said second smart device is wearable and wherein said second smart device comprises: (i) one or more  
15   sensors, wherein at least one sensor is a biological sensor configured to acquire biological input; (ii) a memory; (iii) one or more communications interfaces; (iv) a processor; and (v) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to: 1. determine a  
20   physical or mental status of a user from the input acquired by the one or more biological sensors; 2. in response to the physical or mental status determination, automatically generate a triggering signal to activate a function of said first smart device; and 3. send the triggering signal to said first smart device.

25   **[0091]**        14. The system of any preceding embodiment, wherein said programming of said second smart device is further configured to receive a signal from said first smart device acknowledging the triggering signal was received by said first smart device.

30   **[0092]**        15. The system of any preceding embodiment, wherein the one or more communications interfaces are selected from the group consisting of a wired communications interface, a wireless communications interface, a cellular communications interface, a WiFi communications interface, a near

field communications interface, an infrared communications interface, and a Bluetooth communications interface.

5 [0093] 16. The system of any preceding embodiment, wherein an additional triggering signal is programmed to occur in response to criteria established and input by a user of the wearable device.

10 [0094] 17. The system of any preceding embodiment, wherein the physical or mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

15 [0095] 18. The system of any preceding embodiment, wherein said second smart device further comprises: programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to: (a) determine an environmental status of a user from the input acquired by the one or more environmental sensors configured to acquire environmental input; (b) in response to the environmental status determination, automatically generate a triggering signal to activate a function of said first smart device; and (c) send the triggering signal to said first smart device.

20 [0096] 19. The system of any preceding embodiment, wherein said programming is further configured to: (a) acquire a biometric identifier from at least one sensor worn by a user; (b) authenticate the user of the secure wearable apparatus by the biometric identifier; and (c) communicate with a remote device through the communications interface only if the user is authenticated.

25 [0097] 20. A secure wearable sensor apparatus, comprising: (a) a computer processor with memory; (b) a plurality of sensors operably coupled to the processor; (c) a communications link; and (d) programming in a non-transitory computer readable medium and executable on the computer processor for performing steps comprising: (i) acquiring a biometric identifier from at least one sensor worn by a user; (ii) comparing

the acquired biometric identifier with a biometric identifier standard designated by the user; and (iii) communicating with a remote device through the communications link if the biometric identifiers match.

5 **[0098]** 21. The apparatus of any preceding embodiment, further comprising: at least one haptic output coupled to the computer processor; the haptic output programmed to activate when a communications link is established with a remote device.

10 **[0099]** 22. The apparatus of any preceding embodiment, further comprising: at least one sound generator output coupled to the computer processor; the sound generator output programmed to activate when a communications link is established with a remote device.

15 **[00100]** 23. The apparatus of any preceding embodiment, further comprising: at least one light output coupled to the computer processor; the light output programmed to activate when a communications link is established with a remote device.

**[00101]** 24. The apparatus of any preceding embodiment, wherein said biometric identifier comprises a heart identifier.

20 **[00102]** 25. The apparatus of any preceding embodiment, said programming further configured to: receive a request to initiate communications from the remote device; transmit sensor data to the remote device; and activate a haptic output notifying the user of the transmission.

25 **[00103]** 26. The apparatus of any preceding embodiment, said programming further configured to: transmit commands to the remote device; and receive command code from the remote device through the communications link.

30 **[00104]** 27. A secure wearable sensor system, comprising: (a) a wearable sensor device, comprising: (i) a computer processor with memory; (ii) a plurality of sensors operably coupled to the processor; (iii) a communications link; and (iv) programming in a non-transitory computer readable medium and executable on the computer processor for performing steps comprising: 1. acquiring a biometric identifier from at least one sensor worn by a user; 2. comparing the acquired biometric identifier with a

biometric identifier standard designated by the user; and 3. communicating with a non-wearable device through the communications link if the biometric identifiers match; and (b) a non-wearable device, comprising: (i) a communications link; (ii) a computer processor with memory; (iii) programming in a non-transitory computer readable medium and executable on the computer processor for performing steps comprising: 1. sending and receiving communications from a wearable sensor device; and 2. processing sensor data received from the wearable sensor.

5  
10 **[00105]** 28. The system of any preceding embodiment, wherein said biometric identifier comprises a heart identifier.

**[00106]** 29. The system of any preceding embodiment, said programming of the wearable device further configured to unlock a programming lock in the non-wearable device to process and display sensor data received from the wearable device.

15 **[00107]** 30. The system of any preceding embodiment, said wearable device further comprising: at least one haptic output coupled to the computer processor; the haptic output programmed to activate when a communications link is established with the non-wearable device.

**[00108]** 31. The system of any preceding embodiment, said wearable device further comprising: at least one sound generator output coupled to the computer processor; the sound generator output programmed to activate when a communications link is established with the non-wearable device.

20 **[00109]** 32. The system of any preceding embodiment, said wearable device further comprising: at least one light output coupled to the computer processor; the light output programmed to activate when a communications link is established with the non-wearable device.

**[00110]** 33. The system of any preceding embodiment, said non-wearable device computer processor further comprising a programming interface configured to control the sensors and computer processor of the wearable device over the communications link.

30 **[00111]** 34. A computer implemented method for securing a wearable

device, the method comprising: (a) acquiring a biometric identifier from at least one sensor worn by a user; (b) comparing the acquired biometric identifier with a biometric identifier standard designated by the user; and (c) restricting access to a wearable device if the biometric identifiers do not match; (d) wherein said method is performed by executing programming on at least one computer processor, said programming residing on a non-transitory medium readable by the computer processor.

**[00112]** Although the description above contains many details, these should not be construed as limiting the scope of the technology but as merely providing illustrations of some of the presently preferred embodiments of this technology. Therefore, it will be appreciated that the scope of the present technology fully encompasses other embodiments which may become obvious to those skilled in the art, and that the scope of the present technology is accordingly to be limited by nothing other than the appended claims, in which reference to an element in the singular is not intended to mean "one and only one" unless explicitly so stated, but rather "one or more." All structural, chemical, and functional equivalents to the elements of the above-described preferred embodiment that are known to those of ordinary skill in the art are expressly incorporated herein by reference and are intended to be encompassed by the present claims. Moreover, it is not necessary for a device or method to address each and every problem sought to be solved by the present technology, for it to be encompassed by the present claims. Furthermore, no element, component, or method step in the present disclosure is intended to be dedicated to the public regardless of whether the element, component, or method step is explicitly recited in the claims. No claim element herein is to be construed under the provisions of 35 U.S.C. 112 unless the element is expressly recited using the phrase "means for" or "step for".

## CLAIMS

What is claimed is:

1. A smart wearable device, the device comprising:
  - 5 (a) one or more sensors, wherein at least one sensor is a biological sensor configured to acquire biological input;
  - (b) a memory;
  - (c) one or more communications interfaces;
  - (d) a processor; and
  - 10 (e) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to:
    - (i) determine a physical or mental status of a user from input  
15 acquired by the one or more sensors, wherein at least one sensor is a biological sensor;
    - (ii) in response to a specific physical or mental status determination, automatically generate a triggering signal to activate or deactivate a function of another device; and
    - (iii) send the triggering signal to the other device.
- 20 2. The device of claim 1, wherein the other device is a device selected from the group of devices consisting of a wearable smart device, a mobile device, a tablet, a lap top computer and a desk top computer.
- 25 3. The device of claim 1, wherein said programming is further configured to receive a signal from the other device acknowledging the triggering signal was received by the other device.
- 30 4. The device of claim 1, wherein the one or more communications interfaces are selected from the group consisting of a wired communications interface, a wireless communications interface, a cellular communications interface, a WiFi communications interface, a near field communications interface,

an infrared communications interface, and a Bluetooth communications interface.

5           5.       The device of claim 1, wherein the physical or mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

10           6.       The device of claim 1, further comprising programming residing in the non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to:

- (a)       determine an environmental status of a user from the input acquired by one or more environmental sensors configured to acquire contextual input;
- (b)       in response to the environmental status determination, automatically generate a triggering signal to activate a function of another device; and
- 15       (c)       send the triggering signal to the other device.

20           7.       A computer implemented method for enabling a smart wearable device to automatically generate a triggering signal to active a certain functionality of another device, the method comprising:

- (a)       providing a smart wearable device, wherein the smart wearable device comprises:
  - (i)       one or more sensors, wherein at least one sensor is a biological sensor configured to acquire biological input;
  - 25       (ii)       a memory;
  - (iii)       one or more communications interfaces; and
  - (iv)       a processor;
- (b)       acquiring biological input from one or more biological sensors;
- (c)       processing the acquired biological input to determine a physical or
- 30       mental status of the user;
- (d)       responding to a specific determined physical or mental status of the user by automatically generating a triggering signal to activate a function of

another device; and

(e) sending the triggering signal to the other device using a communications interface;

(f) wherein said method is performed by executing programming on at least one computer processor, said programming residing on a non-transitory medium readable by the computer processor.

8. The method of claim 7, wherein the other device is a device selected from the group of devices consisting of a wearable smart device, a mobile device, a tablet, a lap top computer and a desk top computer.

9. The method of claim 7, further comprising receiving a signal from the other device acknowledging the triggering signal was received by the other device.

10. The method of claim 7, wherein the one or more communications interfaces are selected from the group consisting of a wired communications interface, a wireless communications interface, a cellular communications interface, a WiFi communications interface, a near field communications interface, an infrared communications interface, and a Bluetooth communications interface.

11. The method of claim 7, wherein the physical or mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

12. The method of claim 7, further comprising:

(a) acquiring environmental input from one or more environmental sensors;

(b) processing the acquired environmental input to determine an environmental status of the user;

(c) responding to the determined environmental status of the user by

automatically generating a triggering signal to activate a function of another device; and

(d) sending the triggering signal to the other device using a communications interface.

5

13. A system for automatically generating a triggering signal by a smart wearable device to active a certain functionality of another device, the system comprising:

(a) a first smart device, wherein said first smart device is wearable or  
10 non-wearable and wherein said first smart device comprises:

- (i) one or more sensors;
- (ii) a memory;
- (iii) one or more communications interfaces;
- (iv) a processor; and

15 (v) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to receive and send signals;

(b) a second smart device, wherein said second smart device is  
wearable and wherein said second smart device comprises:

- 20 (i) one or more sensors, wherein at least one sensor is a biological sensor configured to acquire biological input;
- (ii) a memory;
  - (iii) one or more communications interfaces;
  - (iv) a processor; and

25 (v) programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to:

1. determine a physical or mental status of a user from the input acquired by the one or more biological sensors;

30 2. in response to the physical or mental status determination, automatically generate a triggering signal to activate a function of said first smart device; and

3. send the triggering signal to said first smart device.

14. The system of claim 13, wherein said programming of said second smart device is further configured to receive a signal from said first smart device  
5 acknowledging the triggering signal was received by said first smart device.

15. The system of claim 13, wherein the one or more communications interfaces are selected from the group consisting of a wired communications interface, a wireless communications interface, a cellular communications  
10 interface, a WiFi communications interface, a near field communications interface, an infrared communications interface, and a Bluetooth communications interface.

16. The system of claim 13, wherein an additional triggering signal is programmed to occur in response to criteria established and input by a user of the  
15 wearable device.

17. The system of claim 13, wherein the physical or mental status of the user includes information related to one or more of blood sugar, stress, fatigue, anxiety, alertness, heart rate, galvanic skin response, weight, nutrition, digestion  
20 rate, metabolic rate, body temperature, skin temperature, respiration, allergies, sleep patterns, hydration, drug levels, sweat production and blood analysis.

18. The system of claim 13, wherein said second smart device further comprises:

25 programming residing in a non-transitory computer readable medium, wherein the programming is executable by the computer processor and configured to:

(a) determine an environmental status of a user from the input acquired by the one or more environmental sensors configured to acquire  
30 environmental input;

(b) in response to the environmental status determination, automatically generate a triggering signal to activate a function of said first

smart device; and

(c) send the triggering signal to said first smart device.

5 19. The system of claim 13, wherein said programming is further configured to:

(a) acquire a biometric identifier from at least one sensor worn by a user;

(b) authenticate the user of the secure wearable apparatus by the biometric identifier; and

10 (c) communicate with a remote device through the communications interface only if the user is authenticated.

20. A secure wearable sensor apparatus, comprising:

(a) a computer processor with memory;

15 (b) a plurality of sensors operably coupled to the processor;

(c) a communications link; and

(d) programming in a non-transitory computer readable medium and executable on the computer processor for performing steps comprising:

20 (i) acquiring a biometric identifier from at least one sensor worn by a user;

(ii) comparing the acquired biometric identifier with a biometric identifier standard designated by the user; and

(iii) communicating with a remote device through the communications link if the biometric identifiers match.

25

21. The apparatus of claim 20, further comprising:

at least one haptic output coupled to the computer processor;

the haptic output programmed to activate when a communications link is established with a remote device.

30

22. The apparatus of claim 20, further comprising:

at least one sound generator output coupled to the computer processor;

the sound generator output programmed to activate when a communications link is established with a remote device.

23. The apparatus of claim 20, further comprising:  
5 at least one light output coupled to the computer processor;  
the light output programmed to activate when a communications link is established with a remote device.

24. The apparatus of claim 20, wherein said biometric identifier  
10 comprises a heart identifier.

25. The apparatus of claim 20, said programming further configured to:  
receive a request to initiate communications from the remote device;  
transmit sensor data to the remote device; and  
15 activate a haptic output notifying the user of the transmission.

26. The apparatus of claim 20, said programming further configured to:  
transmit commands to the remote device; and  
receive command code from the remote device through the  
20 communications link.

27. A secure wearable sensor system, comprising:  
(a) a wearable sensor device, comprising:  
(i) a computer processor with memory;  
25 (ii) a plurality of sensors operably coupled to the processor;  
(iii) a communications link; and  
(iv) programming in a non-transitory computer readable medium  
and executable on the computer processor for performing steps comprising:  
1. acquiring a biometric identifier from at least one sensor  
30 worn by a user;  
2. comparing the acquired biometric identifier with a  
biometric identifier standard designated by the user; and

3. communicating with a non-wearable device through the communications link if the biometric identifiers match; and

(b) a non-wearable device, comprising:

(i) a communications link;

(ii) a computer processor with memory;

(iii) programming in a non-transitory computer readable medium

and executable on the computer processor for performing steps comprising:

1. sending and receiving communications from a wearable sensor device; and

2. processing sensor data received from the wearable sensor.

28. The system of claim 27, wherein said biometric identifier comprises a heart identifier.

29. The system of claim 27, said programming of the wearable device further configured to unlock a programming lock in the non-wearable device to process and display sensor data received from the wearable device.

30. The system of claim 27, said wearable device further comprising: at least one haptic output coupled to the computer processor; the haptic output programmed to activate when a communications link is established with the non-wearable device.

31. The system of claim 27, said wearable device further comprising: at least one sound generator output coupled to the computer processor; the sound generator output programmed to activate when a communications link is established with the non-wearable device.

32. The system of claim 27, said wearable device further comprising: at least one light output coupled to the computer processor; the light output programmed to activate when a communications link is

established with the non-wearable device.

33. The system of claim 27, said non-wearable device computer processor further comprising a programming interface configured to control the  
5 sensors and computer processor of the wearable device over the communications link.

34. A computer implemented method for securing a wearable device, the method comprising:

10 (a) acquiring a biometric identifier from at least one sensor worn by a user;

(b) comparing the acquired biometric identifier with a biometric identifier standard designated by the user; and

15 (c) restricting access to a wearable device if the biometric identifiers do not match;

(d) wherein said method is performed by executing programming on at least one computer processor, said programming residing on a non-transitory medium readable by the computer processor.

**INTERNATIONAL SEARCH REPORT**

International application No.  
PCT/US15/16713

**A. CLASSIFICATION OF SUBJECT MATTER**  
 IPC(8) - A61B5/00; G06F21/32; H04L9/32 (2015.01)  
 CPC - A61B5/0002; G06F21/32; H04L9/32  
 According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**  
 Minimum documentation searched (classification system followed by classification symbols)  
 IPC(8) Classifications: A61B5/00; G06F21/32; H04L9/32 (2015.01)  
 CPC Classifications: A61B5/0002; G06F21/32; H04L9/32

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)  
 PatSeer (US, EP, WO, JP, DE, GB, CN, FR, KR, ES, AU, IN, CA, INPADOC Data); ProQuest; EBSCO; Google; environment, sensor, input, activate, device, second, another, supplemental, additional, wear, worn, sensor, biological, physiological, data, info, parameter, reading

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

| Category*   | Citation of document, with indication, where appropriate, of the relevant passages   | Relevant to claim No.                   |
|-------------|--|---|
| X<br>—<br>Y | US 2003/0046228 A1 (BERNEY, J) 06 March 2003; abstract; figures 2, 4; paragraphs [0012], [0031]-[0033], [0035], [0036], [0038], [0039]; claim 27 | 1-5, 7-11, 13-17, 19<br><hr/> 6, 12, 18 |
| Y           | US 2004/0010207 A1 (FLAHERTY, J et al.) 15 January 2004; paragraph [0008]  | 6, 12, 18                               |

Further documents are listed in the continuation of Box C.       See patent family annex.

\* Special categories of cited documents:  
 "A" document defining the general state of the art which is not considered to be of particular relevance  
 "E" earlier application or patent but published on or after the international filing date  
 "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)  
 "O" document referring to an oral disclosure, use, exhibition or other means  
 "P" document published prior to the international filing date but later than the priority date claimed  
 "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention  
 "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone  
 "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art  
 "&" document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US15/16713

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

- 1.  Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
- 2.  Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
- 3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1. In order for all inventions to be examined, the appropriate additional examination fee must be paid.

Group I: Claims 1-19 are directed toward a smart wearable device, a computer implemented method, and a system for determining a physical or mental status of a user and sending a triggering signal.

Group II: Claims 20-34 are directed toward a secure wearable sensor apparatus and system for acquiring and comparing a biometric identifier.

The inventions listed as Groups I and II do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons:

\*\*\*-See Supplemental Page-\*\*\*

- 1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
- 2.  As all searchable claims could be searched without effort justifying additional fees, this Authority did not invite payment of additional fees.
- 3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
- 4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:  
Group I: Claims 1-19

Remark on Protest

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.

---Continued from Box III: Lack of Unity of Invention---

The special technical features of Group I include determining a physical or mental status of a user from the input acquired by the one or more biological sensors; in response to the physical or mental status determination, automatically generating a triggering signal to activate a function of another device; and sending the triggering signal to the other device, which are not present in Group II.

The special technical features of Group II include acquiring a biometric identifier from at least one sensor worn by a user; comparing the acquired biometric identifier with a biometric identifier standard designated by the user; and communicating with a remote device through the communications link based on if the biometric identifiers match, which are not present in Group I.

The common technical features shared by Groups I and II are a wearable sensor device, comprising: a computer processor with memory; a plurality of sensors operably coupled to the processor; a communications link; and programming in a non-transitory computer readable medium and executable on the computer processor for performing steps comprising: acquiring a biological input from at least one of the plurality of sensors; making a determination based on the input; and performing a communication with a second device based on the determination; wherein the second device comprises a communications link; a computer processor with memory; and programming in a non-transitory computer readable medium and executable on the computer processor and configured to receive and send signals.

However, these common features are previously disclosed by US 2003/0046228 A1 to Berney, J (hereinafter 'Berney'). Berney discloses a wearable sensor device (wearable apparatus comprising a biometric data reader, paragraph [0012]), comprising: a computer processor with memory (a central processor in communication with a non-volatile ROM (memory), paragraph [0039]); a plurality of sensors operably coupled to the processor (device may comprise a primary biometric data reader and an additional biometric reader such as a temperature sensor, paragraphs [0032] and [0038]); a communications link (wearable apparatus comprises a wireless communication device, paragraph [0012]); and programming in a non-transitory computer readable medium and executable on the computer processor for performing steps (system comprises a non-volatile ROM, and executes a set of logical steps, paragraphs [0020] and [0039]) comprising: acquiring a biological input from at least one of the plurality of sensors (system captures biometric data from biometric data reader, paragraphs [0032]-[0033]); making a determination based on the input (apparatus authenticates a user's identity using biometric data stored on a SmartCard chip, paragraph [0031]); and performing a communication with a second device based on the determination (wearable apparatus communicates authentication to a counterpart transaction device, paragraph [0036]); wherein the second device comprises a communications link (counterpart transaction device communicates wirelessly with AuthentSwitch wearable apparatus, paragraph [0036]); a computer processor with memory; and programming in a non-transitory computer readable medium and executable on the computer processor and configured to receive and send signals (counterpart device is an electronic apparatus and communicates wirelessly with the wearable apparatus, paragraphs [0035]-[0036] and claim 27).

Since the common technical features are previously disclosed by the Berney reference, these common features are not special and so Groups I and II lack unity.

#### 摘要(译)

智能可穿戴设备和方法用于获取关于用户的传感器数据以确定用户的身体和精神状态，并且在通过佩戴者特有的生物统计安全访问来认证时自动激活或去激活其他设备。具体地，智能可穿戴设备可以自动获取用户的生物输入，例如心率，呼吸，体温等，并且基于输入，通过向另一设备发送触发信号来自动激活或停用另一设备中的功能。
