Description**FIELD OF THE INVENTION**

[0001] The present invention relates generally to blood monitoring devices and, more particularly, to a sensor having an integrated lance.

BACKGROUND OF THE INVENTION

[0002] It is often necessary to quickly obtain a sample of blood and perform an analysis of the blood sample. One example of a need for quickly obtaining a sample of blood is in connection with a blood glucose monitoring system where a user must frequently use the system to monitor the user's blood glucose level.

[0003] Those who have irregular blood glucose concentration levels are often medically required to self-monitor their blood glucose concentration level. An irregular blood glucose level can be brought on by a variety of reasons including illness, such as diabetes. The purpose of monitoring the blood glucose concentration level is to determine the blood glucose concentration level and then to take corrective action, based upon whether the level is too high or too low, to bring the level back within a normal range. The failure to take corrective action can have serious implications. When blood glucose levels drop too low, a condition known as hypoglycemia, a person can become nervous, shaky, and confused. That person's judgment may become impaired and that person may eventually pass out. A person can also become very ill if their blood glucose level becomes too high, a condition known as hyperglycemia. Both conditions, hypoglycemia and hyperglycemia, are potentially life-threatening emergencies.

[0004] One method of monitoring a person's blood glucose level is with a portable, handheld blood glucose testing device. A prior art blood glucose testing device 100 is illustrated in FIG. 1. The portable nature of these devices 100 enables the users to conveniently test their blood glucose levels wherever the user may be. The glucose testing device contains a test sensor 102 to harvest the blood for analysis. The device 100 contains a switch 104 to activate the device 100 and a display 106 to display the blood glucose analysis results. In order to check the blood glucose level, a drop of blood is obtained from the fingertip using a lancing device. A prior art lancing device 120 is illustrated in FIG. 2. The lancing device 120 contains a needle lance 122 to puncture the skin. Some lancing devices implement a vacuum to facilitate drawing blood. Once the requisite amount of blood is produced on the fingertip, the blood is harvested using the test sensor 102. The test sensor 102, which is inserted into a testing unit 100, is brought into contact with the blood drop. The test sensor 102 draws the blood to the inside of itself. The test sensor, in combination with the testing unit, then determines the concentration of glucose in the blood. Once the results of the test are displayed on the

display 106 of the test device 100, the test sensor 102 is discarded. Each new test requires a new test sensor 102.

[0005] One problem associated with current test devices is that the test device comprises a two step operation for sample generation and sample harvesting/reading. The two operations are accomplished with two separate instruments (a lance and a test sensor), each having a separate disposable. This requires more parts and more work for the user in disposing the parts.

[0006] Another problem associated with current test devices is the difficulty in harvesting small samples when the test sensor is separate from the lance. There is a trend in glucose testing towards minimizing the sample volume. This trend is based on the assumption that there is a corresponding reduction in pain when less sample volume is acquired. As the sample volume is reduced, it becomes more difficult to manually manipulate the test sensor in order to harvest the blood. This is especially true for people who may have seeing impairments or other disabilities, making it difficult to manipulate the test sensor within a small area.

[0007] Another problem associated with obtaining small sample sizes is related to the precision needed to obtain the samples. When only small amounts of blood are produced by the lance, it is important that the entire sample or most of the sample be drawn into the test device. When larger volumes of blood are drawn, it is less necessary to obtain all of the blood for the sensor. In small volume test devices, it is important that the sensor be located very near to the puncture wound to maximize the amount of blood that is drawn into the sensor for testing. In current test devices, where the sensor has to be manually moved to the puncture wound, it may be difficult to get close enough to the wound to obtain enough of the sample.

[0008] Some current test devices utilize an integrated sensor and lance. The lance is perpendicular to the plane of the test sensor and penetrates through the sensor surface. These sensors, however, still experience the problem that the test sensor must be manually manipulated after the lancing operation is performed.

[0009] Another test device has been developed for the collection of interstitial fluid (ISF) that utilizes an integrated lance and reaction area. ISF is collected by piercing just below the skin before any nerve endings or any capillaries. Collecting ISF is sometimes desirable because there is no pain involved since it is above any nerve endings. The lance in this test device is not strong enough to pierce through the dermal layer of the skin in order to obtain samples of other fluids, such as blood. One disadvantage of this and other integrated systems is that the user is forced to dispose of the lance with each test device, an additional expense, as most users reuse their lancets a number of times. A second disadvantage is that any reagent in the device is necessarily exposed to extreme conditions during the required sterilization of the lance. Such exposure may affect the performance of the device. US 6,120,676 discloses a device according to

the preamble of claim 1.

SUMMARY OF THE INVENTION

[0010] The present invention is a fluid collection apparatus adapted to test a concentration of an analyte in a fluid and is defined in the appended claims. The fluid collection apparatus further includes a spacer disposed between the lid and the base. The spacer forms a capillary channel, which has an opening and is designed to collect the fluid. The capillary channel also includes a reagent that reacts with the fluid to produce a measurable reaction. The reaction will indicate the concentration of the analyte in the fluid. Coupled to the lid is a lance that is moveable to the base and is moveable to a position adjacent the opening of the capillary channel.

[0011] The above summary of the present invention is not intended to represent each embodiment, or every aspect, of the present invention. This is the purpose of the figures and the detailed description which follow.

BRIEF DESCRIPTION OF THE DRAWINGS

[0012] The foregoing and other advantages of the invention will become apparent upon reading the following detailed description and upon reference to the drawings.

FIG. 1 is a top view of a prior art blood glucose testing device.

FIG. 2 is a perspective view of a prior art lance.

FIG. 3 is a top end view of a test device according to one embodiment of the present invention.

FIG. 4a is a front view of a test device having a cover removed according to one embodiment of the present invention.

FIG. 4b is a front view of a test device having a cover removed according to another embodiment of the present invention.

FIG. 5 is a side view of a test device according to one embodiment of the present invention.

FIG. 6 is a top view of the test device of FIG. 5.

FIG. 7 is a top view of the test device according to another embodiment of the present invention.

[0013] While the invention is susceptible to various modifications and alternative forms, specific embodiments have been shown by way of example in the drawings and will be described in detail herein. It should be understood, however, that the invention is not intended to be limited to the particular forms disclosed. Rather, the invention is to cover all modifications, equivalents,

and alternatives falling within the spirit and scope of the invention as defined by the appended claims.

DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS

[0014] FIG. 3 depicts a fluid collection apparatus 10 according to one embodiment of the present invention. The fluid collection apparatus 10 is designed to collect a fluid, such as blood, so the fluid may be tested for the concentration of a particular analyte, such as glucose. In describing the details of the operation of the fluid collection apparatus 10, the fluid described will be blood pricked from a finger and the analyte will be glucose. It is understood that the embodiment may also be used for other fluids and analytes and that these only serve as examples.

[0015] The fluid collection apparatus 10 includes a lid 12, a base 14, and a pair of spacers 16a, 16b disposed between the lid 12 and the base 14. The pair of spacers 16a, 16b form a capillary channel 18. In the illustrated embodiment, the capillary channel 18 is elongated and spans the entire length of the spacers (shown in FIG. 4a). The capillary channel 18 has a first end 20 and a second end 22 (shown in FIG. 4a). The capillary channel 18 includes a reagent 19 that will react with the drawn blood in order to create a measurable reaction. According to one embodiment, the reagent 19 is disbursed throughout the entire capillary channel. A lance 24 is disposed in the capillary channel 18. The lance 24 is moveable through the capillary channel 18 in a direction parallel to the length of the capillary channel 18.

[0016] In one embodiment, the fluid collection apparatus 10 can be used in conjunction with a photometric test device to measure the concentration of the analyte directly, for example, by the absorption of light in the infrared region. The test device would measure the amount of infrared light absorbed. Alternatively, a reagent 19 can be used that causes a change in color in the capillary channel. The photometric test device then reads the amount of color change. Photometric testing is described in more detail in commonly-owned U.S. Patent No. 5,611,999 entitled "Diffuse Reflectance Readhead" which is incorporated herein by reference in its entirety. It is also contemplated that other methods of measuring the concentration of glucose in blood may be utilized.

[0017] In another embodiment of the fluid collection apparatus 10, an electrochemical test device is employed as shown in FIG. 4b. The capillary channel 18 includes a pair of electrodes 25. In electrochemical analysis, the change in current across the electrodes 25 caused by the reaction of the glucose and the reagent 19 creates an oxidation current at the electrodes 25 which is directly proportional to the user's blood glucose concentration. The current can be measured by an electrochemical test device coupled to a pair of terminals (not shown) corresponding to the electrodes 25. The electrochemical test device can then communicate to the user the blood glucose concentration. An example of an electrochemical

test system is described in detail by commonly-owned U.S. Patent No. 5,723,284 entitled "Control Solution And Method For Testing The Performance Of An Electrochemical Device For Determining The Concentration Of An Analyte In Blood" which is incorporated herein by reference in its entirety.

[0018] Turning now to FIG. 4a, a top view of the fluid collection apparatus 10 with the lid 12 removed is shown. As can be seen in this view, the lance 24 extends through the capillary channel 18 and out of the first end 20. The reagent 19 may be placed anywhere within the capillary channel 18.

[0019] In FIG. 4b, an alternative embodiment of the fluid collection apparatus 10 is shown. In this embodiment, the capillary channel 18 includes a detection area 26. The detection area 26 may be a reaction area that includes the reagent 19 and is slightly wider than the rest of the capillary channel 18. The enlarged area makes viewing easier and is used with some optical sensors.

[0020] In one embodiment, the capillary channel 18 is from approximately 0.020 to approximately 0.040 inches in length and from approximately 0.006 to approximately 0.012 inches in width. The lance 24 is from approximately 0.005 to approximately 0.011 inches in diameter. The detection area 26 has an area of approximately 0.7×10^{-3} to approximately 10×10^{-3} inches squared.

[0021] The operation of the device 10 illustrated in the embodiments of FIGS. 3-4b will now be described. A user will position the apparatus such that the second end 22 of the capillary channel 18 is pressed against the skin. The lance 24 is in a first position, shown in FIG. 4a, extending out from the first end 20 of the capillary channel 18. The user then pushes the lance 24 downward to a second position shown in FIG. 4b, such that the lance 24 extends past the second opening 22 of the capillary channel 18 and enters the skin. The lance 24 is pushed downward with enough force to create a puncture wound sufficient to draw blood. The lance 24 has a length greater than the capillary channel 18, allowing the lance 24 to extend past both the first and the second ends 20, 22 of the capillary channel 18. Once the lance 24 has punctured the skin, the user pulls lance 24 out of the skin and up the capillary channel 18, at least past the reaction area 26. Blood is drawn into the capillary channel 18 via capillary action. The reagent 19 in the capillary channel 18 reacts with the blood to create a reaction that can be measured as discussed above. In some embodiments, the capillary channel 18 includes stops (not shown) that prevent the lance 24 from being completely pulled out of the capillary channel 18. In these embodiments, it is only necessary to pull the lance past the location of the reagent 19.

[0022] The fluid collection apparatus 10 as described provides the advantage of placing the harvesting or collection point of the sensor at the same location as the puncture wound from the lance 24. This eliminates the need to move the fluid collection apparatus 10 around after drawing blood in order to harvest the blood. The

device 10 is easier to use, because the users will not have to manually manipulate the sensor after the puncture by trying to place the sensor at the precise location of the puncture.

[0023] Turning now to FIGS. 5 and 6, another embodiment of the present invention will be shown. Like reference numerals will be used to identify like structures. In this embodiment, the fluid collection apparatus 10 includes the base 14, the pair of spacers 16a, 16b, the capillary channel 18 that is defined by the spacers 16a, 16b, the lid 12, and the lance 24. Alternatively, the base and the spacers or the lid and the spacers can be combined into a single piece that has been molded or formed to this three dimensional shape. In the embodiment shown in FIG. 6, the fluid collection apparatus 10 includes a detection area 26. The detection area 26 may be a specific reaction area including the reagent 19. Alternatively, the reagent 19 is dispersed throughout the entire capillary channel 18. In another embodiment, there is no reagent and an infrared detector may be used to measure the absorption of infrared light.

[0024] The collection apparatus 10 also includes a guide 28 for moving the lance. The guide 28 is slidably engaged to the base 14, the spacers 16a, 16b, or the lid 12. The guide 28 is moveable in a direction parallel to the length of the capillary channel 18. The guide 28 is attached to the lance 24. In this embodiment, the lance 24 is not disposed inside the capillary channel 18 but, instead, is adjacent to the capillary channel 18.

[0025] The lance 24 is disposed so that it will draw blood at a location adjacent to the second end 22 of the capillary channel 18. The lance 24 may be located at an angle relative to the capillary channel 18 (such as shown in another alternative embodiment depicted in FIG. 7) or it may be located directly above the capillary channel 18 (shown in FIGS. 5 and 6). Other embodiments are contemplated having the second end 22 of the capillary channel 18 adjacent to the puncture wound, but having different orientations for the lance 24 and the capillary channel 18.

[0026] Returning now to the description relating to FIGS. 5 and 6, the guide 28 is used to move the lance 24 between the first and second positions shown in FIGS. 4a and 4b. When in the second position, the lance will pierce the skin for drawing blood, creating a puncture wound. Because the second end 22 of the capillary channel 18 is adjacent to the puncture wound, blood will flow from the wound into the capillary channel 18 via capillary action without any manual moving of the fluid collection apparatus 10. In this embodiment, the lance 24 only needs to be pulled out of the skin, but does not need to be pulled completely out of the capillary channel 18, since the lance's location will not prevent the blood from entering the capillary channel 18. Since the guide 28 is wider than the lance 24, the guide 28 may be easier for some users to grasp and use than the prior embodiment.

[0027] Turning now to FIG. 7, another embodiment of the present invention will be described. In this embodi-

ment, the lance 24 is disposed in a lance channel 30, having a first end 32 and a second end 34. The lance channel 30 is formed by first and second spacers 16a, 16b. The capillary channel 18 is formed by the second spacer 16b and a third spacer 16c. The lance 24 is moveable within the lance channel 30 in a direction parallel to the length of the channel 30. The lance channel 30 is disposed such that the second end 34 of the lance channel 30 is adjacent to the second end 22 of the capillary channel 18.

[0028] In operation, the fluid collection apparatus 10 is placed against the skin as in the other embodiments. The lance 24 is then pushed downward through the lance channel 30 and into the skin. After the skin is punctured, the lance 24 is withdrawn from the skin, but remains within the lance channel 30. The blood is then drawn into the capillary channel 18, via capillary action. By keeping the lance 24 in the lance channel 30, the lance channel 30 is not able to draw any blood into it, and all of the blood is instead drawn into the adjacent capillary channel 18. Alternatively, at least one face of the lance channel 30 can be of a hydrophobic material that inhibits entry of the blood into the lance channel 30.

[0029] In the illustrated embodiment, the capillary channel 18 includes the detection area 26. In this embodiment, the reagent 19 is kept in the detection area 26, creating the measurable reaction in the detection area 26. In some embodiments, there will not be a specific, enlarged detection area 26 and the reagent 19 will be dispersed elsewhere in the capillary channel 18.

[0030] While the present invention has been described with reference to one or more particular embodiments, those skilled in the art will recognize that many changes may be made thereto without departing from the spirit and scope of the present invention. Each of these embodiments and obvious variations thereof is contemplated as falling within the scope of the claimed invention, which is set forth in the following claims.

Claims

1. A fluid collection apparatus (10) adapted to test a concentration of an analyte in a fluid, comprising:

- a base (14) having a plane;
- a guide (28);
- a spacer (16a, 16b) disposed between said base (14) and said guide (28);
- a capillary channel (18) defined by said spacer (16a, 16b), said capillary channel (18) having an opening (22) for receiving the fluid, and said capillary channel (18) having a detection area (26) for determining the concentration of the analyte in the fluid; and
- a lance (24) movable relative to said base (14) between a first position and a second position, an end of said lance (24), in said second position,

extending beyond said base (14) for puncturing, said lance (24) being coupled to said guide (28), said guide (28) causing said movement of said lance (24) between said first position and said second position, and in that said end of said lance (24), in said second position, is positioned at a location from which said capillary channel (18) can draw fluid via said opening (22) by capillary action, said lance (24) being moveable parallel to said plane of said base (14), and

characterized in that

said detection area (26) is wider than the remainder of said capillary channel (18).

2. The fluid collection apparatus (10) of claim 1, wherein said glide (28) is slidably engaged to said base (14) or said spacer (16a, 16b).
3. The fluid collection apparatus (10) of claim 1, further comprising a lid (12), said lid (12) being disposed between said spacer (16a, 16b) and said guide (28).
4. The fluid collection apparatus (10) of claim 3, wherein said glide (28) is slidably engaged to said base (14), said spacer (16a, 16b), or said lid (12).
5. The fluid collection apparatus (10) of one of the claims 1 to 4, wherein said end of said lance (24), in said second position, is adjacent to said opening (22) of said capillary channel (18).
6. The fluid collection apparatus (10) of one of the claims 1 to 5, wherein said guide (28) is moveable in a direction parallel to said capillary channel (18).
7. The fluid collection apparatus (10) of one of the claims 1 to 6, wherein said lance (24) is moveable between said first position and said second position in a direction parallel to said capillary channel (18).
8. The fluid collection apparatus (10) of one of the claims 1 to 6, wherein said lance (24) is disposed at an acute angle relative to said capillary channel (18).
9. The fluid collection apparatus (10) of one of the claims 1 to 8, further comprising a reagent (19) disposed in said detection area (26) and adapted to produce a reaction indicative of the concentration of the analyte in the fluid.
10. The fluid collection apparatus (10) of one of the claims 1 to 9, wherein said detection area (26) has an area of approximately 0.45 mm^2 ($0.7 \times 10^{-4} \text{ in}^2$) to 6.45 mm^2 ($1.0 \times 10^{-2} \text{ in}^2$).
11. The fluid collection apparatus (10) of claim 9, where-

in said reagent (19) is adapted to produce a colorimetric reaction or an electrochemical reaction.

12. The fluid collection apparatus (10) of one of the claims 1 to 11, wherein said capillary channel (18) has a length of approximately 0.508 mm (0.020 in) to approximately 1.016 mm (0.040 in).
13. The fluid collection apparatus (10) of one of the claims 1 to 12, wherein said remainder of said capillary channel (18) has a width of approximately 0.13 mm (0.005 in) to approximately 0.28 mm (0.011 in).
14. The fluid collection apparatus (10) of one of the claims 1 to 13, wherein said lance (24) has a diameter of approximately 0.13 mm (0.005 in) to approximately 0.28 mm (0.011 in).
15. The fluid collection apparatus (10) of one of claim 1, wherein said lance (24) extends through said capillary channel (18).

Patentansprüche

1. Apparat zum Sammeln von Fluidum (10), der adaptiert ist, um eine Konzentration eines Analyten in einem Fluidum zu testen, umfassend:

eine Basis (14) mit einer Ebene;
 eine Führung (28);
 einen Abstandshalter (16a, 16b), der zwischen der Basis (14) und der Führung (28) angelegt ist;
 ein Kapillarkanal (18), der durch den Abstandshalter (16a, 16b) definiert ist, wobei der Kapillarkanal (18) eine Öffnung (22) zum Aufnehmen des Fluidums aufweist, und der Kapillarkanal (18) einen Detektionsbereich (26) zum Feststellen der Konzentration des Analyten in dem Fluidum aufweist; und
 eine Lanzette (24), die relativ zu der Basis (14) zwischen einer ersten Position und einer zweiten Position bewegbar ist, wobei sich ein Ende der Lanzette (24) in der zweiten Position zum Punktieren über die Basis (14) hinaus erstreckt, wobei die Lanzette (24) mit der Führung (28) gekoppelt ist, wobei die Führung (28) die Bewegung der Lanzette (24) zwischen der ersten Position und der zweiten Position verursacht, und sich das Ende der Lanzette (24) in der zweiten Position an einer Stelle befindet, von welcher der Kapillarkanal (18) durch Kapillarwirkung Fluidum durch die Öffnung (22) ziehen kann, wobei die Lanzette (24) parallel zu der Ebene der Basis (14) bewegbar ist, **dadurch gekennzeichnet, dass** der Detektionsbereich (26) breiter als der Rest des Kapillarkanal (18) ist.

2. Apparat zum Sammeln von Fluidum (10) nach Anspruch 1, wobei die Führung (28) mit der Basis (14) oder dem Abstandshalter (16a, 16b) gleitbar im Eingriff steht.
3. Apparat zum Sammeln von Fluidum (10) nach Anspruch 1, der des Weiteren einen Deckel (12) umfasst, wobei der Deckel (12) zwischen dem Abstandshalter (16a, 16b) und der Führung (28) angeordnet ist.
4. Apparat zum Sammeln von Fluidum (10) nach Anspruch 3, wobei die Führung (28) mit der Basis (14), dem Abstandshalter (16a, 16b) oder dem Deckel (12) gleitbar im Eingriff steht.
5. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 4, wobei das Ende der Lanzette (24) in der zweiten Position zu der Öffnung (22) des Kapillarkanal (18) benachbart ist.
6. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 5, wobei die Führung (28) in einer zu dem Kapillarkanal (18) parallelen Richtung bewegbar ist.
7. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 6, wobei die Lanzette (24) zwischen der ersten Position und der zweiten Position in einer zu dem Kapillarkanal (18) parallelen Richtung bewegbar ist.
8. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 6, wobei die Lanzette (24) relativ zu dem Kapillarkanal (18) in einem spitzen Winkel angeordnet ist.
9. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 8, der des Weiteren ein Reagens (19) umfasst, das in dem Detektionsbereich (26) angeordnet und adaptiert ist, um eine Reaktion zu erzeugen, die die Konzentration des Analyten in dem Fluidum anzeigt.
10. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 9, wobei der Detektionsbereich (26) eine Fläche von etwa $0,45 \text{ mm}^2$ ($0,7 \times 10^{-4} \text{ Inch}^2$) auf $6,45 \text{ mm}^2$ ($1,0 \times 10^{-2} \text{ Inch}^2$) aufweist.
11. Apparat zum Sammeln von Fluidum (10) nach Anspruch 9, wobei das Reagens (19) adaptiert ist, um eine kolorimetrische Reaktion oder eine elektrochemische Reaktion zu erzeugen.
12. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 11, wobei der Kapillarkanal (18) eine Länge von etwa 0,508 mm (0,020 Inch) bis etwa 1,016 mm (0,040 Inch) aufweist.

13. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 12, wobei der Rest des Kapillarkanals (18) eine Breite von etwa 0,13 mm (0,005 Inch) bis etwa 0,28 mm (0,011 Inch) aufweist.
14. Apparat zum Sammeln von Fluidum (10) nach einem der Ansprüche 1 bis 13, wobei die Lanzette (24) einen Durchmesser von etwa 0,13 mm (0,005 Inch) bis etwa 0,28 mm (0,011 Inch) aufweist.
15. Apparat zum Sammeln von Fluidum (10) nach einem von Anspruch 1, wobei die Lanzette (24) durch den Kapillarkanal (18) verläuft.

Revendications

1. Appareil (10) de collecte de fluide adapté pour tester la concentration d'un analyte dans un fluide, l'appareil comprenant :

une base (14) dotée d'un plan,
un guide (28),
un écarteur (16a, 16b) disposé entre ladite base (14) et ledit guide (28),
un canal capillaire (18) défini par ledit écarteur (16a, 16b), ledit canal capillaire (18) présentant une ouverture (22) de réception du fluide et ledit canal capillaire (18) présentant une zone de détection (26) qui permet de déterminer la concentration de l'analyte dans le fluide et
une lancette (24) apte à se déplacer par rapport à ladite base (14) entre une première position et une deuxième position, une extrémité de ladite lancette (24) s'étendant dans ladite deuxième position au-delà de ladite base (14) en vue de perforer, ladite lancette (24) étant raccordée audit guide (28), ledit guide (28) amenant ledit déplacement de ladite lancette (24) entre ladite première position et ladite deuxième position, ladite extrémité de ladite lancette (24) étant disposée dans ladite deuxième position en un emplacement depuis lequel ledit canal capillaire (18) peut extraire du fluide par ladite ouverture (22) sous une action capillaire, ladite lancette (24) pouvant être déplacée parallèlement audit plan de ladite base (14), **caractérisé en ce que** ladite zone de détection (26) est plus large que le reste dudit canal capillaire (18).

2. Appareil (10) de collecte de fluide selon la revendication 1, dans lequel ledit guide (28) est engagé à coulissement sur ladite base (14) ou ledit écarteur (16a, 16b).
3. Appareil (10) de collecte de fluide selon la revendication 1, comprenant en outre un couvercle (12), ledit couvercle (12) étant disposé entre ledit écarteur

(16a, 16b) et ledit guide (28).

4. Appareil (10) de collecte de fluide selon la revendication 3, dans lequel ledit guide (28) est engagé à coulissement sur ladite base (14), ledit écarteur (16a, 16b) ou ledit couvercle (12).
5. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 4, dans lequel ladite extrémité de ladite lancette (24) est adjacente dans ladite deuxième position à ladite ouverture (22) dudit canal capillaire (18).
6. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 5, dans lequel ledit guide (28) peut être déplacé dans une direction parallèle audit canal capillaire (18).
7. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 6, dans lequel ladite lancette (24) peut être déplacée entre ladite première position et ladite deuxième position dans une direction parallèle audit canal capillaire (18).
8. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 6, dans lequel ladite lancette (24) est disposée sous un angle aigu par rapport audit canal capillaire (18).
9. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 8, comprenant en outre un réactif (19) disposé dans ladite zone de détection (26) et adapté pour produire une réaction qui indique la concentration de l'analyte dans le fluide.
10. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 9, dans lequel ladite zone de détection (26) présente une superficie d'environ 0,45 mm² (0,7 x 10⁻⁴ pouces²) à 6,45 mm² (1,0 x 10⁻² pouces²).
11. Appareil (10) de collecte de fluide selon la revendication 9, dans lequel ledit réactif (19) est adapté pour produire une réaction calorimétrique ou une réaction électrochimique.
12. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 11, dans lequel ledit canal capillaire (18) a une longueur d'environ 0,508 mm (0,020 pouce) à environ 1,016 mm (0,040 pouce).
13. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 12, dans lequel ledit reste dudit canal capillaire (18) a une largeur d'environ 0,13 mm (0,005 pouce) à environ 0,28 mm (0,011 pouce).
14. Appareil (10) de collecte de fluide selon l'une des revendications 1 à 13, dans lequel ladite lancette

(24) a un diamètre d'environ 0,13 mm (0,005 pouce)
à environ 0,28 mm (0,011 pouce).

15. Appareil (10) de collecte de fluide selon l'une de la
revendication 1, dans lequel ladite lancette (24) 5
s'étend dans ledit canal capillaire (18).

摘要(译)

一种流体收集装置，适于测试流体中分析物的浓度，包括盖子和基座。还包括设置在盖子和基座之间的垫片。间隔物形成毛细管通道，其具有开口并设计用于收集流体。毛细管通道包括与流体反应以产生可测量反应的试剂。该反应将提供流体中分析物浓度的可测量指示。与盖子连接的是可移动到基部的喷枪，并且可移动到邻近毛细管通道的开口的位置。
