(57) **ABSTRACT**

Systems and methods for electronically monitoring chest sounds and/or sensing electrical cardiac signals such as ECG signals are provided. In one embodiment, a hybrid stethdiographer has a sensing assembly with a chestpiece and a user interface. Stethdiographer also includes a conduit, a power source compartment, a pair of binaurals and a corresponding pair of earpieces. The user interface includes a record button, a mode selector and a display screen. The chestpiece includes a diaphragm and a plurality of electrical cardiac sensors.

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This Continuation Application claims the benefit of U.S. application Ser. No. 15/478,189, filed on Apr. 3, 2017, of the same title, which application is a Non-Provisional application and claims the benefit of U.S. Provisional Application No. 62/319,770, filed on Apr. 7, 2016, which applications are incorporated herein in their entirety by this reference.

BACKGROUND

[0002] The present invention relates to systems and methods for electronically monitoring chest sounds and/or ECG (electrocardiogram) of a subject.

[0003] Currently, electronic stethoscopes have emerged to overcome some of these limitations of acoustic stethoscopes. Most of these electronic stethoscopes are capable of amplifying and filtering the acoustic signals thereby substantially increasing their capabilities over the acoustic stethoscopes.

[0004] However, in addition to being able to monitor chest sounds, there is often a need for primary care providers and emergency services personnel to measure electrical cardiac signals, e.g., ECG signals, which are beyond the capability of these modern electronic stethoscopes.

[0005] It is therefore apparent that an urgent need exists for hybrid devices that are able to measure chest sounds and/or ECG signals. These improved hybrid devices have the selectable multi-purpose capability while substantially retaining the familiarity and resulting ease of use associated with stethoscopes in daily use by primary care providers and emergency services personnel.

SUMMARY

[0006] To achieve the foregoing and in accordance with the present invention, systems and methods for electronically monitoring chest sounds and/or electrical cardiac signals such as ECG signals are provided.

[0007] In one embodiment, a hybrid stethdiographer has a sensing assembly with a chestpiece and a user interface. Stethdiographer also includes a conduit, a compartment for a power source, a pair of Y-splits, a pair of binaurals and a corresponding pair of earpieces.

[0008] In this embodiment, the user interface includes a record button, a mode selector, a display screen, a rewind button, a pause button, a fast forward button and a power activator and/or indicator. The chestpiece includes a diaphragm and a housing accommodating a plurality of electrocardio sensors.

[0009] In some embodiments, stethdiographer also includes one or more ECG sensors on the top surface of the sensing assembly so as to be able to record signals from the subject's fingertips, signals that are traditionally measured using the subject's limbs.

[0010] Note that the various features of the present invention described above may be practiced alone or in combination. These and other features of the present invention will be described in more detail below in the detailed description of the invention and in conjunction with the following figures.

BRIEF DESCRIPTION OF THE DRAWINGS

[0011] In order that the present invention may be more clearly ascertained, some embodiments will now be described, by way of example, with reference to the accompanying drawings, in which:

[0012] FIGS. **1**A and **1**B are top and bottom perspective views, respectively, illustrating one embodiment of a hybrid stethdiographer in accordance with the present invention;

[0013] FIGS. **2** and **3** illustrate an exemplary operating environment for the hybrid stethdiographer of FIGS. **1**A-**1**B;

[0014] FIGS. **4**A and **4**B depict exemplary screenshots illustrating the operation of the hybrid stethdiographer of FIGS. **1**A-**1**B;

[0015] FIG. **5** is a top perspective view illustrating another embodiment of a hybrid stethdiographer in accordance with the present invention;

[0016] FIGS. **6**A-**6**B and **6**C depict exploded and assembled perspective views illustrating assembly of one embodiment of a chestpiece for the hybrid stethdiographer of FIGS. **1**A-**1**B;

[0017] FIGS. **7**A-**7**B and **7**C depict exploded and assembled perspective views illustrating assembly of another embodiment of a chestpiece for the hybrid stethdiographer of FIGS. **1**A-**1**B;

[0018] FIGS. **8**A and **8**B depict cross-sectional perspective views illustrating one embodiment of a cardiac sensor for the hybrid stethdiographer of FIGS. **1**A-**1**B; and

[0019] FIG. **9** depicts cross-sectional perspective views illustrating an alternative means for securing a cardiac sensor to the hybrid stethdiographer of FIGS. **1**A-**1**B.

DETAILED DESCRIPTION

[0020] The present invention will now be described in detail with reference to several embodiments thereof as illustrated in the accompanying drawings. In the following description, numerous specific details are set forth in order to provide a thorough understanding of embodiments of the present invention. It will be apparent, however, to one skilled in the art, that embodiments may be practiced without some or all of these specific details. In other instances, well known process steps and/or structures have not been described in detail in order to not unnecessarily obscure the present invention. The features and advantages of embodiments may be better understood with reference to the drawings and discussions that follow.

[0021] Aspects, features and advantages of exemplary embodiments of the present invention will become better understood with regard to the following description in connection with the accompanying drawing(s). It should be apparent to those skilled in the art that the described embodiments of the present invention provided herein are illustrative only and not limiting, having been presented by way of example only. All features disclosed in this description may be replaced by alternative features serving the same or similar purpose, unless expressly stated otherwise. Therefore, numerous other embodiments of the modifications thereof are contemplated as falling within the scope of the present invention as defined herein and equivalents thereto. Hence, use of absolute and/or sequential terms, such as, for example, "always," "only," "will," "will not," "shall," "shall not," "must," "must not," "first," "initially," "next," "subsequently," "before," "after," "lastly," and "finally," are not

meant to limit the scope of the present invention as the embodiments disclosed herein are merely exemplary.

[0022] The present invention relates to systems and methods for electronically monitoring chest sounds and/or electrical cardiac signals such as ECG signals thereby alleviating the need for multiple discrete medical devices such as having both stethoscopes in addition to electrocardiogram machines.

[0023] To facilitate discussion, FIGS. **1**A and **1**B are top and bottom perspective views, respectively, illustrating one embodiment of a hybrid stethdiographer **100** in accordance with the present invention.

[0024] In this embodiment stethdiographer **100** includes a sensing assembly with a chestpiece **110** and a user interface **120**. Stethdiographer **100** also includes a conduit **130**, a compartment **140**, a pair of Y-splits **152**, **154**, a pair of binaurals **162**, **164** and a corresponding pair of earpieces **172**, **174**.

[0025] FIG. **1**A also depicts an enlarged top view of the user interface **120** having a record button **122**, a mode selector **124**, a display screen **126**, a rewind button **127***a*, a pause button **127***b*, a fast forward button **127***c* and a power activator and/or indicator **128**. FIG. **1**B depicts an enlarged bottom view of chestpiece **110** having a diaphragm **118** and a housing **116** accommodating a plurality of electro-cardio sensors **112***a*, **112***b* . . . **112***m* configured to sense a subset of V1-V6 heart signals (see Appendix A).

[0026] Together FIGS. **2** and **3** illustrate an exemplary operating environment for stethdiographer **100**. For example, a medical facility, such as a primary care clinic **341** can support a wide variety of devices **100**, **221**, **222**, **223**, **224**, **225**, **226**, **227**, **228** communicating with each other via a local area network **260**. These devices **100**, **221**, **222**, **223**, **224**, **225**, **226**, **227**, **228** can in turn communicate, via WAN **280**, with one or more devices of other device clusters (not shown) inside other localities such as hospitals **341**, long term care homes **342**, ambulances **343**, pharmacies **344**, laboratories **346** and remote servers **348** associated with, for example, health insurance companies.

[0027] FIGS. **4**A and **4**B depict exemplary screenshots **410**, **415**, **420** and exemplary screenshots **430**, **440**, **450**, respectively, illustrating the operation of stethdiographer **100**.

[0028] Referring back to FIGS. **1**A and **1**B, stethdiographer **100** is configured to operate in one or more of the following Modes.

[0029] 1) Stethoscope Auscultation Modes:

[0030] a) Bell

[0031] b) DIA

[0032] c) LUNG/WIDE

[0033] 2) Stethoscope Functional Modes:

[0034] a) Electronic Stethoscope Mode

[0035] b) Clinical Mode

[0036] c) Analysis Mode

[0037] d) Tele-Med Mode

[0038] e) Tele-Med Live Mode

[0039] 3) Record, Save, Replay and Transfer **10** on device stored Heart Sounds

[0040] 4) Data transfer using Bluetooth and/or USB cable

[0041] 5) Dedicated Record Start and Stop Button

[0042] 6) Dedicated Auscultation Mode selection button

[0043] 7) Heart Rate Display

[0044] A) Electronic Stethoscope Mode (Standard Activation)

[0045] In this mode, stethdiographer **100** can function as a conventional electronic stethoscope, i.e., a user can auscultate in BELL/DIA/LUNG mode:

[0046] i) Record Heart Sound and ECG data

[0047] ii) Save Heart Sounds and ECG Data

[0048] iii) Replay Heart Sounds in desired auscultation mode

[0049] Transfer the recorded Heart Sounds and ECG Data by switching on the Bluetooth. In this mode, a HD APP (an exemplary software application) executing on external devices, for example, one or more of mobile devices **221**, **224**, **225**, **226**, is not yet synced with stethdiographer **100** and hence the HD APP features may not active.

[0050] B) Clinical Mode (Standard Activation)

[0051] In Clinical mode, the functions of Basic Stethoscope Mode are available on stethdiographer **100**. Additionally, user can use the HD APP functions when stethdiographer **100** is synced with the HD APP. Accordingly, the user can auscultate in BELL/DIA/LUNG mode:

[0052] i) Record Heart Sound and ECG data

[0053] ii) Save Heart Sounds and ECG Data

[0054] iii) Replay Heart Sounds in desired auscultation mode

[0055] iv) Transfer recorded/saved Heart Sounds and ECG data

[0056] v) Real time PCG and ECG wave form on HD APP display screen

[0057] vi) Replay recorder and saved Heart Sounds and ECG Data on HD APP

[0058] vii) Hear saved Heart Sounds on HD APP using stethdiographer **100**.

[0059] viii) Hear saved Heart Sounds on HD APP using external speakers (Headphones, Mobile/PC/Tablet speakers)

[0060] C) Analysis Mode (Standard Activation)

[0061] In Analysis mode, the functions of Clinical Mode are available via stethdiographer **100**. Additionally, the user can hear real time Heart Sounds on stethdiographer **100**. With stethdiographer **100**, the user can also auscultate in BELL/DIA/LUNG mode:

[0062] i) Record Heart Sound and ECG data

[0063] ii) Save Heart Sounds and ECG Data

[0064] iii) Replay Heart Sounds in desired auscultation mode

[0065] iv) Transfer recorded/saved Heart Sounds and ECG data

[0066] v) Real time PCG and ECG waver form on HD APP display screen with color indicators for Heart Sound and ECG anomalies.

[0067] vi) Real Time Heart Sounds can be heard using HD APP device using external speakers (Headphones, Mobile/PC/Tablet speakers)

[0068] vii) Replay recorder and saved Heart Sounds and ECG Data on HD APP

[0069] viii) Hear saved Heart Sounds on HD APP using stethdiographer **100**

[0070] ix) Hear saved Heart Sounds on HD APP using external speakers (Headphones, Mobile/PC/Tablet speakers)

[0071] D) Tele-Med LIVE Mode (Remote Activation)

[0072] Referring also to FIGS. **2** and **3**, in Tele-Med mode, the functions of Analysis Mode can also be available locally using stethdiographer **100**. Additionally, the user can push the Heart Sounds and ECG data to a HD APP device via LAN **260** and/or WAN **280**, thereby enabling a remote user to access the data and can replay the recorded Heart Sound and ECG data using HD APP on the remote device. User can also auscultate in BELL/DIA/LUNG mode:

[0073] i) Record Heart Sound and ECG data

[0074] ii) Save Heart Sounds and ECG Data

[0075] iii) Replay Heart Sounds in desired auscultation mode

[0076] iv) Transfer recorded/saved Heart Sounds and ECG data

[0077] v) Real time PCG and ECG waver form on HD APP display screen with color indicators for Heart Sound and ECG anomalies

[0078] vi) Real Time Heart Sounds can be heard using HD APP device using external speakers (Headphones, Mobile/PC/Tablet speakers)

[0079] vii) Replay recorder and saved Heart Sounds and ECG Data on HD APP

[0080] viii) Push the recorder/saved Hear Sound and ECG Data via cloud to remote user

[0081] ix) Remote user can hear received Heart Sounds on HD APP using stethdiographer **100**

[0082] x) Remote user can hear saved Heart Sounds on HD APP using external speakers (Headphones, Mobile/PC/Tablet speakers)

[0083] In some embodiments, as shown in FIGS. **6**A and **6**B, exploded perspective views illustrating an exemplary chestpiece subassembly **600** for hybrid stethdiographer **100**, sub-assembly **600** includes a printed circuit board (PCB) **610**, a PCB holder **620**, an O-ring **630**, a diaphragm **640**, a diaphragm holder **650** with snap locks **652**, **654** and a chestpiece cover **660**. FIG. **6**C includes a cross-sectional view AA-AA of sub-assembly **600** depicting how diaphragm holder **650** can be snapped into recesses **622**, **624** of PCB holder **620**. Cover **660** may provide concealment for screws **612**, **614** (not shown) configured to secure the above described components of sub-assembly **600** to each other. Cover **660** can be made from a suitable material such as rubber or foam.

[0084] FIGS. **7**A-7B and **7**C depict exploded and assembled perspective views illustrating another embodiment of a chestpiece subassembly **700** for hybrid stethdiographer **100**. Sub-assembly **700** includes a PCB **710**, a PCB holder **720**, an O-ring **730**, a diaphragm **740**, a diaphragm holder **750** and a chestpiece cover **760**. In this embodiment, diaphragm holder **750** includes a pair of locking stubs **755**, **756** configured to be rotatably secured to a corresponding pair of ramps **725**, **726** of PCB holder **720**, thereby increasing the engagement of O-ring **730** and diaphragm **740**, compressed and sandwiched between diaphragm holder **750** and PCB holder **720**.

[0085] Referring now to FIGS. **8**A and **8**B, cross-sectional perspective views illustrating one embodiment of a cardiac sensor **800** for hybrid stethdiographer **100**. Cardiac sensor **800** includes an electrode **840** and an insulating cap **830**. In this embodiment, electrode **840** has a groove **842** configured to mate with a corresponding ridge **832** of cap **830** during assembly. Once assembled, sensor **800** is configured to be seated securely in PCB holder **820** from downward pressure exerted by printed circuit board (PCB) **810**, as shown in FIG. **8**B. Electrode **840** can be made from a suitable conductor such as brass. Cap **830** can be made from a suitable insulator such as plastic.

[0086] FIG. **9** includes cross-sectional perspective views depicting an alternative cardiac sensor subassembly for hybrid stethdiographer **100**. In this embodiment, hybrid stethdiographer **100** includes a PCB holder **920** with at least one co-molded insulating cap **930** configured to house a corresponding electrode **940**. During assembly, electrode **940** is inserted into co-molded cap **930** and seated securely in PCB holder **920** from downward pressure exerted by printed circuit board (PCB) **910**.

[0087] In some embodiments, in addition to having an internal sound transducer such as a microphone (not shown) operatively coupled to the diaphragm (e.g., diaphragm **118**, **640** or **740**), hybrid stethdiographers (e.g., stethdiographer **100**) may also include an external sound transducer (not shown) configured to sense ambient sounds thereby enabling these hybrid stethdiographers to provide ambient noise cancellation. In addition, the existence of a secondary external sound transducer such as a microphone may also enable these hybrid stethdiographers to provide hands-free dictation, transcription and/or real-time translation capabilit(ies) for the user.

[0088] Many modifications and additions are to the above described embodiment of hybrid stethdiographer **100** are possible. For example, as shown in FIG. **5**, stethdiographer **500** also include additional sensors **521**, **523**, **525**, **529** configured to measure a subset of RL, RA, LL and LA signals from the subject's fingertips (see Appendix A). In addition, one of these sensors **521**, **523**, **525**, **529** may be a fingerprint sensor to facilitate user and/or subject identification.

[0089] While this invention has been described in terms of several embodiments, there are alterations, modifications, permutations, and substitute equivalents, which fall within the scope of this invention. Although sub-section titles have been provided to aid in the description of the invention, these titles are merely illustrative and are not intended to limit the scope of the present invention.

[0090] It should also be noted that there are many alternative ways of implementing the methods and apparatuses of the present invention. It is therefore intended that the following appended claims be interpreted as including all such alterations, modifications, permutations, and substitute equivalents as fall within the true spirit and scope of the present invention.

What is claimed is:

1. A portable hybrid stethdiographer configured to measure chest sounds and cardiac signals, the stethdiographer comprising:

a sensing assembly including a chestpiece and a user interface, wherein the chestpiece includes a diaphragm configured to sense chest sounds from a subject, and wherein the chestpiece also includes a plurality of cardiac sensors configured to sense cardiac signals from the subject;

a conduit configured to transfer the chest sounds from the sensing assembly;

a compartment;

a pair of Y-splits configured to split the chest sounds from the conduit;

a pair of binaurals configured to channel the chest sounds from the Y-splits; and

a pair of earpieces configured to provide chest sounds from the binaurals to a user.

2. The hybrid stethdiographer of claim **1** wherein the compartment is configured to house a power source.

3. The hybrid stethdiographer of claim **1** wherein the cardiac signals are ECG (electrocardiogram) signals.

4. The hybrid stethdiographer of claim **1** wherein the user interface includes a record button, a mode selector, a display screen, a rewind button, a pause button, a fast forward button and a power activator or indicator.

5. The hybrid stethdiographer of claim **4** wherein the display screen is configured to display at least one of the chest sounds and the cardiac signals.

6. The hybrid stethdiographer of claim **1** further comprising a first and a second top cardiac sensors configured to sense additional cardiac signals from at least two fingertips of the subject.

7. The hybrid stethdiographer of claim **6** wherein the additional cardiac signals are ECG signals.

8. The hybrid stethdiographer of claim **6** wherein the display screen is configured to display at least one of the additional cardiac signals.

9. The hybrid stethdiographer of claim **1** further comprising a fingerprint sensor.

10. The hybrid stethdiographer of claim **1** wherein each of the plurality of cardiac sensors includes an insulating cap and an electrode.

11. The hybrid stethdiographer of claim **1** further comprising an internal sound transducer operatively coupled to the diaphragm.

12. The hybrid stethdiographer of claim **1** further comprising an external sound transducer configured to sense ambient sounds thereby providing ambient noise cancellation.

13. The hybrid stethdiographer of claim **12** wherein the external sound transducer is further configured to provide at least one of hands-free dictation, transcription and real-time translation.
