(54) 【発明の名称】 管腔内底皺壁形成実行方法及び該方法を使用するための装置

(57) 【要約】

本発明は、管腔内底皺壁形成を実行する方法及び装置に関する。胃腸食道接合部の一部分を掴み胃腸内に引き込むために用いられるユニット、及び底の一部を食道に向けて動かすユニットを含む装置は患者の胃腸に食道を通じて挿入され、個所に取り付けられる。装置は又、胃腸壁と食道壁を一緒に保持するために用いられ、食道及び胃腸間のバルブを形成するファスナーを配置することができる。前記二つの壁の縫合を安定させるために接着化合物を使うことができる。

【特許請求の範囲】

【請求項 1】

患者の食道及び胃腸の管腔内底皺壁形成を実行する下記を具備する方法：

前記食道の選択された部分を前記胃腸に引き入れ、及び前記胃腸の底部を前記食道に置換えることで前記食道の前記胃腸への重積陥入を形成し；

重積陥入間の留め具を定置させることにおいて、前記留め具は互いに隣接した重積陥入を形成せうる食道壁及び胃壁を維持し；

前記重積陥入を癒着させるために前記食道壁及び前記胃壁間に癒着液を注入する。

【請求項 2】

さらに前記重積陥入癒着後に前記留め具を除去することを備えた請求項 1 に記載された方法。 10

【請求項 3】

さらに下記の事前ステップを備えた請求項 1 に記載された方法：

内視鏡装置を前記食道を通して導入し及び胃食道接合部に近接して定置し；

前記食道の開口部を掴み及び引っ張るために適用される把握装置を前記内視鏡装置から延長し；及び

前記胃腸の底部を置換するために適用される上皮組織置換装置を前記内視鏡装置から延長する。

【請求項 4】

さらに下記を備えた請求項 1 に記載された方法： 20

留め具届け装置を前記食道を通して導入し及び希望する堅牢化個所の重積陥入に近接して定置し；

前記食道壁を胃腸壁に付着させるために前記留め具を前記届け装置から届ける。

【請求項 5】

さらに下記を備える請求項 4 に記載された方法：

前記留め具届け装置から前記重積陥入を形成する前記食道壁及び前記胃腸壁を通してハイポ管を延長し；

前記留め具の引出しを負前記具ために前記留め具の遠端を配置し；

前記重積陥入から前記ハイポ管を引出し；及び

前記食道壁を前記胃腸壁に近接して保持するために前記留め具の近端を配置する。 30

【請求項 6】

さらに前記定置及び届けステップを選択した回数だけ繰り返すことを備える請求項 4 に記載された方法。

【請求項 7】

さらに継続的に前記届け装置を配置し及び前記重積陥入の周囲の選択した個所に前記留め具を届けることをさらに備えた請求項 4 に記載された方法。

【請求項 8】

前記配置ステップはさらに前記留め具の遠端及び近端に配置された袋状物を膨張させることを備えることを特徴とする請求項 5 に記載された方法。

【請求項 9】

前記配置ステップはさらにさらに前記留め具の遠端及び近端に配置された変形可能部分を延長させることを備えることを特徴とする請求項 5 に記載された方法。 40

【請求項 10】

前記注入ステップはさらに粘着性及び硬化液の少なくとも一つを注入することを備えることを特徴とする請求項 1 に記載された方法。

【請求項 11】

前記重積陥入を形成し及び前記留め具を配置するステップは、さらに下記を具備すること

を特徴とする請求項 1 に記載された方法：
把握部分及び上皮組織置換部分を有するファスナー装置を前記食道を通して導入し及び胃腸食道接合部に隣接して配置し；

前記把握部分で前記食道の開口部を把握し、及び前記開口部を前記胃腸に引き入れ；
前記上皮組織置換部分を前記ファスナー装置のきぬた骨部分に向けて旋回して、前記胃腸壁及び前記食道壁が前記きぬた骨部分及び前記旋回した上皮組織転置部分の間になるように、前記胃腸の底部分を前記食道に向けて動かし；
前記胃腸壁及び前記食道壁を通して前記上皮組織転置部分上に配置されているファスナーの有刺部分を作動させ；及び
前記ファスナーの前記有刺部分を前記きぬた骨部分上に配置されている前記ファスナーの合致するウォッシャー部分に対して確保する。

【請求項 12】

管腔内底皺壁形成を実行する下記ステップを具備する方法： 10
患者の食道を通じて前記患者の胃腸に内視鏡を挿入し；
前記食道を通じて把握装置を胃腸食道接合部に隣接する位置に挿入し；
前記食道を通じて上皮組織置換装置を胃腸食道接合部に隣接する位置に挿入し；
食道壁を形成するために、前記把握装置により前記食道の選択された部分を把握し及び前記胃腸内に動かし；
胃腸壁を形成するために、前記上皮組織置換装置により前記胃腸の底部を前記食道壁に向けて置換し；
前記食道を通じて接合装置を前記胃腸食道接合部に隣接する位置に挿入し；及び
前記食道壁を前記胃腸壁に付着させるために、前記接合装置からファスナーを配置する。

【請求項 13】

さらに前記胃腸壁と前記食道壁の間に粘着及び硬化液の一つを注入するステップをさらに 20
備える請求項 12 に記載された方法。

【請求項 14】

前記把握装置、上皮組織置換装置、及び接合装置の少なくとも一つの挿入経路を定めるために、前記食道上に覆管を挿入するステップをさらに備える請求項 12 に記載された方法。

【請求項 15】

選択された回転により前記接合装置を回転し、及び前記配置ステップを繰り返すステップをさらに備える請求項 12 に記載された方法。

【請求項 16】

前記回転ステップは前記接合装置を約 30 度回転させることを備えることを特徴とする請求項 15 に記載された方法。 30

【請求項 17】

前記食道壁に対して前記胃腸壁を付着した後に前記ファスナーを除去するステップをさらに備える請求項 12 に記載された方法。

【請求項 18】

患者の食道及び胃腸の管腔内底皺壁形成を実行する下記を具備する装置： 40
前記患者の食道を通じて前記胃腸に内視鏡を挿入するために遠端に適用された柔軟管；
前記食道の選択された部分を把握するために適用される前記柔軟管の遠端に配置された上皮組織把握装置；
前記胃腸の底部を前記食道に向けて動かすために適用される前記上皮組織把握装置に隣接して配置される上皮組織置換装置；及び
前記上皮組織置換部分に対して旋回可能なきぬた骨部分であって、前記上皮組織置換装置及び前記きぬた骨部分は着脱可能であってファスナーの付属部分を保持し、前記底部分が前記食道に向かって動いたときには前記付属部分は結合する、ことを特徴とする。

【請求項 19】

前記食道の選択された個所を動かすために適用される前記柔軟管の有刺部分をさらに具備する請求項 18 に記載された装置。

【請求項 20】

前記上皮組織把握装置は前記上皮組織置換装置とは独立して操作可能な一組のはさみ口を 50

具備することを特徴とする請求項 18 に記載された装置。

【請求項 21】

前記ファスナーは有刺部分及び合致するウォッシャー部分をさらに具備する請求項 18 に記載された装置。

【請求項 22】

前記上皮組織置換装置及び前記きぬた骨部分の旋回により、前記食道の前記選択された箇所及び前記胃腸の前記動かされた底部を前記上皮組織置換装置及び前記きぬた骨部分の間に配置することを特徴とする請求項 18 に記載された装置。

〔発明の分野〕

本発明は、一般に、胃腸の食道に対する底皺壁形成技術に関する。とくに、本発明は、そのような底皺壁形成を管腔内で実行する方法、及び食道に底を保持する装置に関する。

【0002】

〔発明の背景〕

底皺壁形成は、胃腸食道接合部（GEJ）の変形、及び／又は機能不全の下部食道括約筋の結果しばしば生じる疾病であって、典型的に、胃腸食道逆流（GER）状態の治療に使われる。GERに関連する普通の兆候は、胃腸の内容物の食道への嘔吐又は逆流である。底壁皺形成処置は、食道への逆流を防ぐためのGEJのバルブを形成するために、食道及び胃腸の上皮組織を操作することに向けられている。バルブは胃腸を陥入させるように食道を操作し、それから食道の遠端の周りの胃腸の底を包み込み、及びその包んだ位置で胃腸を保持することにより形成される。

20

【0003】

最も普通に使われる底皺壁形成では、包み込み及び保持が実行できるように、腹部又は胸部の切開が必要になる。このような手術は非常な侵襲性の性格をもつことから、合併症や死亡もかなりのケースで発生する。さらにこれらの処置は実行するのに何時間も要するように長時間がかかり、切開が施された場所に醜い傷口を残す。

【0004】

他の最近開発された底皺壁形成処置は、腹腔内視鏡下手術用口又は経皮内視鏡胃フィステル形成（例えば米国特許番号 5,403,326 及び 5,088,979、これらの内容を参照して以下説明する）を利用することにより、幾分、大掛かりな手術切開をする必要を限定している。これらの処置は、大掛かりな腹部及び胸部切開が絡むものより侵襲性は小さいが、とはいえ侵襲することには違いは無く、それらの侵襲的手術に伴うコスト及びリスクを負う。例えば、これらの処置の最中に一般的な麻酔が施されるが、それはこれらの処置の費用に加えられ、及び周知のリスクを伴う。

30

【0005】

現行の底皺壁形成方法の侵襲的性格に伴う合併症、リスク及びコストに加えて、これらの方法には他の問題もある。一つのそのような問題は、底部包みのずれと呼ばれる底の包みが解けることである。現行の方法ではずれはしばしば生じ、適切に皺にした底部を保持することができなくなる。

40

【0006】

〔発明の要約〕

本発明は、まず胃腸食道接合部の付着部分を見つけるために柔軟内視鏡を使う管腔内底皺壁形成方法に関する。そして上皮組織把握装置が内視鏡の遠端に配置され、見つけれられた身体上皮組織付着箇所に取り付けられる。次に上皮組織置換装置が内視鏡の遠端に配置され、食道の上皮組織重積を胃腸内腔に形成する目的で、胃腸の底部を置換するために使われる。そして、ファスナー配置装置が第1の望んだファスナー配置位置に隣接して配置され、望んだファスナー配置位置に重積を形成する上皮組織と通して第1のファスナーを配置するために使われる。第1のファスナーは食道の胃底の第1の部分保持する。そしてファスナー配置装置は追加的に望んだファスナーの複数の位置に追加的ファスナーを配置

50

するために使われ、胃腸底部を食道の周りに保持する。一つの実施態様では、ファスナー配置装置、上皮組織把握装置、及び上皮組織置換装置は単独のユニットに統合されている。

【0007】

最後に、内視鏡の遠端に注入装置が配置され、癒着液を重積を形成する上皮組織に注入するために使われる。例えば、癒着剤は線維性固着剤又は接着液である。

【0008】

一つの実施態様では、本発明は、患者の食道及び胃腸の管腔内底皺壁形成を実行する下記を具備する方法：前記食道の選択された部分を前記胃腸に引き入れ、及び前記胃腸の底部を前記食道に置換えることで前記食道の前記胃腸への重積陥入を形成し；重積陥入間の留め具を定置させることにおいて、前記留め具は互いに隣接した重積陥入を形成せうる食道壁及び胃壁を維持し；前記重積陥入を癒着させるために前記食道壁及び前記胃壁間に癒着液を注入する。

10

【0009】

もう一つの実施態様では、本発明は、患者の食道及び胃腸の管腔内底皺壁形成を実行する下記を具備する装置：前記患者の食道を通じて前記胃腸に内視鏡を挿入するために遠端に適用された柔軟管；前記食道の選択された部分を把握するために適用される前記柔軟管の遠端に配置された上皮組織把握装置；前記胃腸の底部を前記食道に向けて動かすために適用される前記上皮組織把握装置に隣接して配置される上皮組織置換装置；及び前記上皮組織置換部分に対して旋回可能なきぬた骨部分であって、前記上皮組織置換装置及び前記きぬた骨部分は着脱可能であってファスナーの付属部分を保持し、前記底部分が前記食道に向かって動いたときには前記付属部分は結合する、ことを特徴とする。

20

【0010】

〔発明の詳説〕

本発明の方法は、例えば、好ましくは上皮組織把握装置18（図1に示す）、上皮組織置換装置22（図2に示す）、ファスナー配置装置24（図3に示す）、及び注入装置28（図4に示す）を備えた柔軟内視鏡16により実行することができる。内視鏡は、好ましくは様々な装置が通過可能な一つ以上の覆鞘を有する。例えば、内視鏡は、覆鞘の内腔を通る上皮組織置換装置を備え、内視鏡操作者により内視鏡の遠端を通して管理可能に延長できる。さらに内視鏡は好ましくは、ファスナー配置装置が通過し及び注入装置がその遠端で操作可能な第2の覆鞘の経路を有する。内視鏡操作者は、上皮組織把握装置、上皮組織置換装置、ファスナー配置装置、及び注入装置を含んで内視鏡を、内視鏡の近端から操作できる。

30

【0011】

この処置には異なるタイプの内視鏡を使うことができる。必要であれば、追加的な道具の挿入を円滑にするために、一つ以上の経路を有する覆管を底皺壁形成場所に内視鏡上から差し入れることができる。例えば、図15aには、水路、吸入路、光源、ビデオ・フィードバックを提供する幾つかの経路を有する内視鏡16を表す。この例示内視鏡16は一つの作業用経路Aを含む。追加道具の挿入を円滑にするために、覆管20を使い、内視鏡16の遠端に達する追加的作業経路E及びFを画する鞘を形成する。同様に、図15aは、二つの作業経路A及びBをもつ内視鏡16'を表す。この場合は、覆管20'は一つの追加的作業経路Fを単に提供しなければならない。ここでの話では、「内視鏡装置」とは一般に内視鏡及び、必要なときは、追加的作業経路を画する覆管を指すために用いられる。

40

【0012】

一つの実施態様では、患者の腹部は治療を円滑にするために空気を吹き込まれている。患者は又、処置の間、静脈麻酔注射により鎮静されている。

【0013】

本方法では、柔軟内視鏡16はまず患者の口に差し込まれ、図1のとおり食道10を通り腹部に入る。そこで挿入された内視鏡16は、胃腸食道接合部の付着個所14を見つけるために使われる。処置を施す内視鏡操作者又は他の実施者は、内視鏡でGEJを覗くこと

50

で場所を見つけることができる。内視鏡により目標個所を見つけるこれらの方法は公知で、従来技術でよく用いられている。

【0014】

上皮組織把握装置 18 は見つけられた個所に配置され、図 1 に示すようにその上皮組織を把握して保持するために使われる。上皮組織把握装置 18 は、内視鏡 16 の内腔を通り、実施者により内視鏡 16 の近端で操作可能である。好ましくは、実施者は装置 18 の着脱のみならず装置 18 が当該個所に適用する力もコントロールすることができる。この力は装置 18 延ばしたり、内視鏡 16 の遠端に向けて装置 18 を引っ込めることでコントロールできる。上皮組織把握装置 18 が取り掛かり、又は把握し、上皮組織を保持する手段は、鉤、引っ掛け具、把握具、それらの組合せなど、従来技術で公知である。

10

【0015】

G E J の上皮組織が把握された後は、食道 10 の重積 22 が効果的に胃腸 32 内に形成されるように、図 2 に示すように、胃腸底 12 を置換するために上皮組織置換装置 22 が使われる。上皮組織置換装置 22 は、内視鏡 16 を囲む覆管 20 の内腔を通り、内視鏡 16 の遠端の位置に押し付けられたり又は旋回させたりすることができる。装置 22 は、好ましくは、硬いケーブルかナイチノル・バンドの遠端に位置する球体端 23 を具備する。実施者は、上皮組織置換装置 22 を、例えば、押ししたり又はそれを胃腸底に向かって旋回させることで操作することができる。

【0016】

一端、胃腸底 12 に対する位置が決まると、上皮組織置換装置 22 は、胃腸底 12 に対して押ししたり、再配置したりするためにさらに押し付けられたり、旋回したりする。同様に、上皮組織把握装置 18 は、付着個所 14 の上皮組織を保持し、上皮組織置換装置 22 により供給される力に対抗して力を掛ける。これらの相反する力の正味の効果により、胃腸底 12 は、参照番号 34 により正確に彼と特定されている角度を為し、食道に極めて近い位置に運ばれる。胃腸底 12 の置換は上皮組織片 30 を形成し、それは有効に食道 10 が胃腸 32 に入った重積となる。一つの実施態様では、上皮組織片は長さ約 1 から 3 センチになる。

20

【0017】

実施態様では、上皮組織把握装置 18 により上皮組織を引っ張り、上皮組織置換装置 22 により底を置換するステップは、重積の周囲の幾つかの位置で繰り返される。例えば、この処置は食道の周囲の 4 つから 12 の等間隔の個所で実行される。

30

【0018】

彼 34 の角度の縮小及び重積 30 の形成は、胃内容物の食道 10 への逆流の程度を減少させる。胃腸と食道の間に実質的にバルブが構築される。胃腸内腔 32、さらに詳しくは胃腸底 12 にガスが溜まるに従い、食道 10 の包まれた部分に圧力が掛かり、それを胃腸から閉じる。さらに胃内容物は、胃筋肉の収縮及び一般的な身体の動きにより胃腸内腔 32 内で顫動する。重積 30 により、胃内容物が食道 10 に達するために通過しなくてはならない障害のようなバルブを作ることにより、G E R が和らげられる。

【0019】

重積された食道 30 は、その配置を固定するために次に胃腸底 12 の壁に縛りつけられる。ファスナー配置装置 24 は胃腸及び食道上皮組織をその個所に保持するために重積 30 内にファスナー 26 を挿入する目的で使われる。典型的には操作を施す上皮組織には神経や血管が通っているので、実施者は、ファスナー 26 を挿入する前に、神経や血管を見つけてそれらを傷つけないようにしなければならない。とくに、実施者は、食道、大動脈、及び様々な胃血管を通じる迷走神経束を見つけておかなければならない。このような解剖学的特徴を見つける様々な方法は、超音波、光学顕微鏡及び X 線を含む従来技術で公知である。

40

【0020】

一端、前述の特徴が見つかり、実施者はファスナー 26 をファスナー配置装置 24 に付けて、装置 24 を配置装置 24 の操作端が望むファスナー挿入場所に配置されるまで第 2

50

の鞘経路 25 を通じて挿入する。そして装置 24 は、図 3 のように望む場所にファスナーを配置するために使われる。ファスナー 26 は、好ましくは新しく作られた上皮組織縁 30 の先 14 の 1 cm 及び 2.5 cm 上に重積を通して挿入され、胃腸内腔 32 に伸長する。ファスナー 26 はまた、上皮組織縁の長さに沿って他の場所にも挿入することができ、実施態様では長さは約 1 及び 3 cm である。

【0021】

ファスナー配置装置 24 は、食道の全周囲にファスナーを挿入するために、食道及び胃腸内腔ないで旋回することができる。好ましくは、ファスナーは 30 度離して挿入される。例えば、初めの挿入個所から、装置 24 は一つの方向に旋回し、初めの場所から 30 度、60 度、120 度及び 180 度と旋回する。そして装置 24 は、初めの挿入個所に戻り、反対方向へ、再び例えば 30 度間隔で、重積の全周囲が縫合されるまでファスナーを挿入する。 10

【0022】

好ましくは、重積は 360 度全部、すなわち食道の全周囲に伸長すべきである。重積により形成されるバルブは、「胃腸食道反射疾病 (GERD) 標準」又は腹腔手術、組立て式かまぼこ型底皺形成と同様である。しかし、全 360 度は内腔アプローチでは達成不可能であるかもしれない。その場合は、鬘状 (toupet) 底皺形成で、食道の周囲約 270 度範囲が実行することができる。

【0023】

したがって、内腔処置では、食道の裏側約 60 度の半円範囲は、一般に実行できない。食道周囲の残余の部分には、ファスナーは例えば 30 度間隔で付着させることができる。 20

【0024】

図 5 はファスナー配置装置 24 を通って挿入され、さらに進み食道及び胃腸壁、それぞれ 44 および 46 の両方の上皮組織を貫通する斜角のハイポ管 40 を表す。ハイポ管 40 は、例えば、皮下注射針套管か、又は好ましくはステンレス製の薄い管の他のタイプで可能である。

【0025】

公知技術の T ファスナー 42 は、ファスナー 42 の遠端が重積の胃腸側に適用されるまでハイポ管 40 を通じて挿入することができる。そしてハイポ管 40 は、鞘 24 に向けて引き抜かれ、T ファスナーの適用された遠端が、図 6 に示すように、ハイポ管 40 が引き抜かれるに従って胃腸壁 46 に噛み合うようにする。図 7 のように、ハイポ管 40 は、さらに T ファスナーの近端が、T ファスナーの遠端から行使される圧力によりハイポ管をから抜け出るまで、鞘 24 内に引き抜かれる。そして T ファスナー 42 の近端は、食道の内壁に対して着地し、胃腸壁及び食道壁の両方を一緒に保持する。T ファスナーの縦中心部分の長さは、食道の内壁及び底の内壁の間の最大長を決定する。 30

【0026】

図 9-11 は食道及び胃腸壁を保持するために使われる T ファスナーの様々なコンフィグレーションを表す。伝統的な T ファスナー 48 は、各端に簡単な T バーを有する。このファスナーにより、変形後位置での胃腸及び食道上皮組織を保持する力は、ファスナー各端の T バーにより担われ、力を分散するための小部分を有する。このタイプの T バーは胃腸及び食道のいずれかの壁を通して引くことができる。したがって、上皮組織を保持する力を分散させるより広い場所と合わせて、本発明と共に T バー・コンフィグレーションの T ファスナーを利用することが望ましい。図 9 は、各端に二つの T ボルスタを有する T ファスナーを表す。さらに、上皮組織を保持する力を分散させる場所は、例えば三つ股、4 股、または 6 股（それぞれ図 10, 9, 及び 11 に示す）の T ファスナーを利用することにより増大させることができる。 40

【0027】

図 12 は、本発明に従って胃腸及び食道上皮組織を保持するために使うことのできる代替的なファスナー 56 を表す。ファスナー 56 は、各端に膨張可能袋 58 を備えた縦中心部分を有する。このファスナー 56 は、T ファスナー挿入に関して上述したと同様のやり方 50

で、胃腸及び食道上皮組織を通して挿入することができる。一端ファスナー５６の位置が定まると、空気、水または他の物資を膨張可能端５８に挿入することができ、端５８を膨らませて、胃腸及び食道上皮組織を保持することができる。膨張可能端は球形または円盤状である。

【００２８】

一つの実施態様では、袋は図１２のようにファスナー４２の遠端に作られ、壁４４，４６への挿入中、ハイポ管４０内に納められる。ハイポ管４０が引出されると、ハイポ管４０内に作られた膨張管を通して流体が通り、袋が膨張する。ハイポ管４０からの分離の前に、ファスナー４２の近端の袋を膨らますために同様のプロセスが実施される。公知デザインのシールを膨張した両方の袋の保持に使うことができる。

10

【００２９】

図１３－１４は、本発明に従った胃腸及び食道を保持するために使うことのできるもう一つの代替的ファスナー６０を表す。ファスナー６０は、近端及び遠端近くに変形可能部分６２，６４を伴った縦要素部品で、好ましくは、ポリプロピレンまたは他のバイオ並立耐性材料により作ることができる。

【００３０】

変形部分６２，６４は、好ましくは、ファスナー６０がもう一つに押し付けられたときに、例えば、撓むことにより、放射状に拡張することのできるメッシュ状構造を有する。ファスナー６０は、図５－７のように、Ｔファスナー挿入に関して先述したのと同様なやり方で、胃腸及び食道上皮組織に挿入することができる。近端及び遠端が食道及び胃腸のそれぞれで望む位置になると、端は拡張される。

20

【００３１】

一つの実施態様では、ファスナー６０は、図１３ｂのように、変形された位置に向かって通常傾きがあるように形成することができる。このタイプのファスナー６０は、減少された直径コンフィグレーションに維持され、一方、ハイポ管４０内に保持され、及びそこから解き放たれると自然の傾きにために拡張される。変形可能部分６２及び６４は、配置装置２４を通し及び胃腸及び食道上皮組織の両方を通じてファスナーの挿入を可能とするように圧力を掛けられる。そしてファスナー６０は、遠位の変形可能部分６４がハイポ管４０の遠端を抜け出るまでハイポ管４０を通して進み、その通常放射状に拡張された位置に再び戻る。そしてハイポ管４０は、引っ込み、近位の変形可能部分６２がその通常の放射状に拡張された位置に拡張することを許容する。そこで変形可能部分６２及び６４は、胃腸及び食道上皮組織を適切な位置に保持するためのボルスタとして作動する。

30

【００３２】

代替的に、変形可能部分６０を有するファスナー６０は、図１３ａのように、通常上方変形部分として作ることができる。通常上方変形ファスナーは、通常変形実施態様に関して上述したのと同様のやり方で胃腸及び食道上皮組織を通して挿入できる。通常上方変形ファスナーはそこで、食道及び胃腸上皮組織の範囲のなかで望む位置に配置された後に、図１３ｂに用に変形された位置に操作される。内視鏡内腔を通して挿入される皺寄せ装置がこのような処置をするために用いられる。この装置はリベット挿入に用いられる公知のメカニズムに似ている。当業者には明らかなように、変形部分を撓ませるためにファスナー６０の端に圧力を掛けることができ、内視鏡の内腔を通して挿入できるいずれの装置であっても、皺寄せ装置として使うことができる。

40

【００３３】

ファスナー６０はまた、挿入を支援するための遠端の針状ポイントにより作ることでもできる。このような遠端により、ファスナー６０を直接胃腸及び食道上皮組織を通して挿入することが可能になり、ハイポ管４０の必要がなくなる。

【００３４】

図１６に示すように、図５－７との関係で先述したハイポ管４０は、ファスナー１０２を適用する挿入装置１００に換えることができる。図１６ａのように、挿入装置１００が食道及び胃腸壁４４，４６を跨いで配置されたときは、内視鏡１６の長さに延長された活性

50

ワイア 104 が引かれ、図 16 b のように遠位ステント 106 が適用される。挿入装置 100 が引き抜かれたときには、活性ワイア 104 は、図 16 c のように再び引かれ、近位ステント 108 が適用され、及び壁 44, 46 は図 16 d のようにステント 106, 108 の間に挟み込まれる。

【0035】

本発明に従った、異なる実施態様では、図 14 のように、有刺タック 70 及び合致ウォッシャー 74 を具備する二葉ファスナーを採用することができる。有刺タック 70 は、有刺コネクタ 72 をもつ円盤部分 71 を構成する。有刺コネクタ 72 は、合致ウォッシャー 74 を通して挿入でき、コネクタ 72 はウォッシャー 74 とかみ合う。コンポーネント 70 及び 74 の両方は、好ましくは、弾力ポリマー材料から作られる。

10

【0036】

本発明に従った装置の代替的なもう一つの実施態様では、有刺タック 70 及び合致ウォッシャー 74 は、図 17 a から 17 e までに示されるように、皺壁形成装置 120 を使って挿入される。図 17 a は、食道 10 を通じて患者の胃腸 32 に挿入される柔軟管 121 の端の装置 120 を表す。手順を監視するために内視鏡 16 を導入することもできる。一端配置されると、装置 120 は図 17 b のように、胃腸底 12 に向けて位置を動かす旋回可能上皮組織置換部分 124 を適用する。

【0037】

装置 120 の把握部分 128 は、図 17 c のように、胃腸食道接合部の付着箇所 14 を把握するために使われ、装置 120 の下方運動により食道 10 の領域を胃腸 32 内に引っ張る。この手順を容易にするために鉤 130 も使うことができる。一端食道開口部が適当な位置に配置されると、上皮組織置換装置 124 が装置 120 のきぬた骨部分に向けて旋回し、底 12 が食道に向けて押されて、重積を形成する。

20

【0038】

上皮組織置換部分 124 がきぬた骨部分 126 に到達すると、図 17 d のように、上皮組織置換部分 124 上に搭載されたファスナーの有刺部分 70 は、胃腸壁 46 及び食道壁 44 を貫き、きぬた骨部分 126 上に搭載された合致ウォッシャー 74 を保持する。この処置の結果、上皮片 132 が形成される。本発明に従った他の実施態様について前述したように、この処置は、図 17 e のように、食道 10 から胃腸 32 を分離する、望んだ形のバルブを形成するために、食道の周囲の異なる周辺場所で繰り返すことができる。

30

【0039】

最後に、図 4 のように、接着液が重積の上皮に注入され、皺壁形成の胃腸及び食道上皮組織を保持する線維性反応が生じる。例えば、モルイン酸ナトリウムは胃腸及び食道上皮間に形成される上皮包に注入される公知の液で、胃腸底を食道に永久に粘着させる線維性反応を生じさせる。

【0040】

接着液として幾つかの化合物を使うことができる。例えば、シアン化アクリル酸塩だけでなく、フィブリン密封剤、筋肉硬化プロテイン、成長要素変化ベータ、プララミン・ジェル、ゼラチン - レソシネル - フォルマル・ジェル及びヒストアクリルなどを使うことができる。硬化剤化合物としては、モルイン酸ナトリウム、ナトリウム四化硫酸塩、エタノラミン・オレイン酸塩、エアゾル剤及び滅菌ブエオミチン硫酸塩を使うことができる。

40

【0041】

このような接着液が使われたときには、ファスナーは、液により生じた反応がその位置の上皮を保持するまで上皮を保持する必要があるだけである。そして使われたファスナーは生分解又は生吸収性物質で形成され、または除去することができる。

【図面の簡単な説明】

(54) Title: METHOD FOR PERFORMING ENDOLUMINAL FUNDOPLICATION AND APPARATUS FOR USE IN THE METHOD

(57) Abstract: A method and device for performing endoluminal fundoplication are described. A device is inserted in the patient's stomach through the esophagus, including a unit adapted to grasp and pull a portion of the gastroesophageal junction into the stomach, and a unit adapted to move a portion of the fundus towards the esophagus. The device also can place fasteners to hold the gastric wall and the esophageal wall secured together, thus forming a valve between esophagus and stomach. An adhesive compound can be used to stabilize the juncture of the two walls.

WO 02/28289

PCT/US01/29593

**METHOD FOR PERFORMING ENDOLUMINAL FUNDOPLICATION AND
APPARATUS FOR USE IN THE METHOD**

5 Field of the Invention

The present invention relates generally to the art of fundoplicating the stomach to the esophagus. More specifically, the present invention relates to a method for performing such a fundoplication endoluminally, and to an apparatus for securing the fundus to the esophagus.

10

Background of the Invention

Fundoplication is a surgical procedure which is typically used to treat Gastroesophageal Reflux (GER) condition, a malady often resulting from a deformity of the gastroesophageal junction (GEJ), and/or a dysfunctional lower esophageal sphincter (LES). One symptom commonly associated with GER is regurgitation or reflux of stomach contents into the esophagus. Fundoplication procedures are directed towards manipulating esophageal and gastric tissue so as to form a valve at the GEJ which limits reflux into the esophagus. The valve is formed by manipulation of the esophagus so as to invaginate the stomach, then wrapping the fundus of the stomach around the distal end of the esophagus and securing the stomach in that wrapped position.

15

20

The most commonly used fundoplication procedures require abdominal or thoracic incisions through which the abdominal wrapping and securing can be performed. Due to the highly invasive nature of such surgery, complications and morbidity occur in a significant percentage of cases. In addition, these procedures are lengthy, often taking a number of hours to perform, and may leave disfiguring scars where the incisions were made.

25

Other recently developed fundoplication procedures somewhat limit the necessity of making large surgical incisions by utilizing laparoscopic ports or

WO 02/28289

PCT/US01/29593

percutaneous endoscopic gastrostomy. (See, e.g. United States Patent Nos. 5,403,326, and 5,088,979, the contents of which are hereby incorporated by reference). Although these procedures are less invasive than those involving large abdominal and thoracic incisions, they are invasive nonetheless, and have costs and risks associated with such invasive surgery. For example, general anaesthesia is typically used during these procedures which adds to the expense of these procedures and entails well known risks.

In addition to the complications, risks, and costs associated with the invasive nature of current fundoplication methods, these methods have other problems as well. One such problem is unwrapping of the fundus, also referred to as slippage of the fundal wrap. Slippage frequently occurs with current methods, as they fail to adequately secure the plicated fundus.

Summary of the Invention

The present invention is directed to a method for endoluminal fundoplication in which a flexible endoscope is first used to locate an attachment site at the gastroesophageal junction. A tissue grasping device is then positioned at the distal end of the endoscope, and attached to the body tissue at the located attachment site. Next, a tissue displacement device is positioned at the distal end of the endoscope and used to displace the fundus of the stomach, so as to create an intussusception of the esophagus into the gastric lumen. A fastener delivery device is then positioned adjacent to a first desired fastener delivery location and used to place a first fastener through the tissue which forms the intussusception at the desired fastener delivery location. The first fastener secures a first portion of the gastric fundus to the esophagus. The fastener delivery device is then used to place additional fasteners at a plurality of additional desired fastener locations, thus securing the gastric fundus around the esophagus. In one exemplary embodiment, the fastener delivery device, the tissue grasping device, and the tissue displacement device can be incorporated into a single unit.

WO 02/28289

PCT/US01/29593

Finally, an injection device is positioned at the distal end of the endoscope and used to inject a bonding agent into the tissue which forms the intussusception. For example, the bonding agent can be an agent for fibrotic fixation or adhesion.

5 In one embodiment, the invention is a method for performing endoluminal fundoplication of a patient's esophagus and stomach, having the steps of forming an intussusception of the esophagus into the stomach by pulling a selected portion of the esophagus into the stomach, and by displacing a fundus portion of the stomach towards the esophagus, placing a fastener across the
10 intussusception, said fastener maintaining an esophageal wall and a gastric wall forming the intussusception adjacent to one another, and injecting a bonding agent between the esophageal wall and a gastric wall to bond the intussusception.

In another embodiment, the invention is a device for performing
15 endoluminal fundoplication of a patient's esophagus and stomach, comprising a flexible tube having a distal end adapted for insertion in the stomach through the esophagus, a tissue grasping device disposed at the distal end of the flexible tube, adapted to grasp a selected portion of the esophagus, a tissue displacement device disposed adjacent the tissue grasping device, adapted to
20 move a fundus portion of the stomach towards the esophagus and an anvil portion, pivotable relative the tissue displacement portion, wherein the tissue displacement device and the anvil portion releasably carry complementary portions of a fastener, such that said complementary portions are joined when the fundus portion is moved towards the esophagus.

25

Brief Description of the Drawings

The invention will be more readily understood through the following detailed description, with reference to the accompanying drawings, in which:

5 Figs 17a to 17e are diagrams showing the steps of operation of a different embodiment of a system according to the present invention, which includes a fundoplication device.

Detailed Description of the Invention

10 The method of the present invention can be performed, for example, using a flexible endoscope 16, which is preferably equipped with a tissue grasping device 18 (shown in Figure 1), a tissue displacement device 22 (shown in Figure 2), a fastener delivery device 24 (shown in Figure 3), and an injection device 28 (shown in Figure 4). The endoscope preferably has one or more oversheath channels through which various devices may pass. For example, the endoscope
15 may be equipped with a tissue displacement device which passes through the lumen of an oversheath channel, and can be controllably extended past the distal end of the endoscope by the endoscopist. In addition, the endoscope preferably has a second oversheath channel through which a fastener delivery device passes and an injection device operable at its distal end. The endoscopist can
20 operate the endoscope, including the tissue grasping device, tissue displacement device, fastener delivery device, and injection device from the proximal end of the endoscope.

Different types of endoscopes can be used for this procedure. If necessary, an overtube with one or more passages can be slipped over the
25 endoscope to the location of the fundoplication, to facilitate insertion of additional tools. For example, Figure 15a shows an endoscope 16 having several channels 15 that provide irrigation, suction, illumination and video feedback. This exemplary endoscope 16 includes one working channel A. To facilitate insertion of additional tools, an overtube 20 can be used, forming a sheath that defines

additional working channels E and F that reach the distal end of endoscope 16. Similarly, Figure 15b shows an endoscope 16' having two working channels A and B. In this case, an overtube 20' only has to provide a passage for one additional working channel F. In this discussion, an "endoscopic device" is used to generally indicate an endoscope and, when required, an overtube defining additional working channels.

In one embodiment, the patient's stomach is insufflated to facilitate the operation. The patient can also be sedated with an intravenous anesthesia injection during the procedure.

Using the present method, the flexible endoscope 16 is first inserted into the patient's mouth, passed through the esophagus 10 and into the stomach, as shown in Figure 1. The inserted endoscope 16 is then used to locate an attachment site 14 at the gastroesophageal junction. The endoscopist, or other practitioner performing the procedure, can locate the site by viewing the GEJ through the endoscope. These methods for endoscopically locating target sites are well known and widely used in the art.

The tissue grasping device 18 can be positioned at the located attachment site 14, and engaged so as to grasp and hold that tissue, as shown in Figure 1. The tissue grasping device 18 passes through a lumen of the endoscope 16 and is operable from the proximal end of the endoscope 16 by the practitioner. Preferably, the practitioner can control the engaging/disengaging of the device 18, as well as the tension which the device 18 applies to the engaged tissue. This tension can be controlled by extending the device 18 past or retracting the device 18 towards the distal end of the endoscope 16. The means with which the tissue grasping device 18 engages, or grasps, and holds the tissue can consist of a hook, clamp, grasper, a combination thereof, or the like, as is known in the art.

After tissue at the GEJ has been grasped, the tissue displacement device 22 is used to displace the gastric fundus 12 so as to effectively create an intussusception 30 of the esophagus 10 into the stomach 32, as shown in Figure

WO 02/28289

PCT/US01/29593

2. The tissue displacement device 22 passes through a lumen of an overtube 20 which surrounds the endoscope 16, and can be pushed or rotated to a position distal to the distal tip of the endoscope 16. The device 22 preferably comprises a spherical tip 23 located at the distal end of a stiff cable or Nitinol band. The practitioner can operate the tissue displacement device 22, for example, by pushing and rotating it into position against the gastric fundus.

Once in position against the gastric fundus 12, the tissue displacement device 22 is further pushed and rotated so as to press against and reposition the gastric fundus 12. Simultaneously, the tissue grasping device 18 holds the tissue at the attachment site 14, applying a force which opposes force supplied by the tissue displacement device 22. The net effect of these counteracting forces is that the gastric fundus 12 is brought in closer proximity to the esophagus, which makes the angle of His, identified at reference numeral 34, more acute. The displacement of the gastric fundus 12 creates a tissue flap 30, which is effectively an intussusception of the esophagus 10 into the stomach 32. In one preferred embodiment, the flaps of tissue can have an approximate length between 1 and 3 cm.

In a preferred embodiment, the steps of pulling the tissue with the tissue grasping device 18 and displacing the fundus with the tissue displacement device 22 are repeated at several positions around the circumference of the intussusception. For example, the procedure can be performed at four to twelve equidistant locations around the circumference of the esophagus.

The reduction in the angle of His 34 and formation of an intussusception 30 reduces the degree to which stomach contents can reflux into the esophagus 10. A valve is essentially built between the stomach and the esophagus. As gases build up in the gastric lumen 32 and, more specifically, in the gastric fundus 12, pressure is brought to bear on the wrapped portion of the esophagus 10, closing it off from the stomach. In addition, stomach contents move around within the gastric lumen 32 due to contraction of the stomach muscles, and body

WO 02/28289

PCT/US01/29593

movement in general. The intussusception 30 alleviates GER by creating a valve like barrier which stomach contents must pass through in order to reach the esophagus 10.

5 The intussuscepted esophagus 30 is then fastened to the wall of the gastric fundus 12 to fix the arrangement. The fastener delivery device 24 is used to insert fasteners 26 within the intussusception 30 to hold the gastric and esophageal tissue in place. Since a number of nerves and blood vessels typically run through the tissue being manipulated, the practitioner should, before inserting the fasteners 26, locate the nerves and blood vessels, so as not to damage or
10 sever them. In particular, the practitioner should locate the Vagus nerve bundle which runs alongside the esophagus, the aorta, and the various gastric blood vessels. Numerous methods for locating such anatomical features are well known in the art, including use of ultrasound, fluoroscopy and x-ray.

Once the aforementioned features are located, the practitioner loads a
15 fastener 26 into the fastener delivery device 24 and inserts the device 24 through a second sheath channel 25 until the operating end of the delivery device 24 is positioned at a desired fastener insertion site. The device 24 is then used to place a fastener at a desired site, as shown in Figure 3. Fasteners 26 are preferably inserted through the intussusception at 1cm and 2.5 cm above the tip
20 14 of the newly-formed tissue flap 30, which extends into the gastric lumen 32. The fasteners 26 can be inserted also at other locations along the length of the tissue flap, which in the preferred case has a length of between about 1 and 3 cm.

The fastener delivery device 24 can be rotated within the esophagus and
25 gastric lumen so as to insert fasteners around the entire circumference of the esophagus. Preferably, fasteners are inserted at locations approximately 30° apart. For example, from an initial insertion site, the device 24 may be rotated in one direction, inserting fasteners at 30°, 60°, 120°, and 180° from the initial site. The device 24 is then returned to the initial insertion site and rotated in the

WO 02/28289

PCT/US01/29593

opposite direction, again inserting fasteners at, for example, 30° intervals, until the entire circumference of the intussusception has been fastened.

Preferably, the intussusception should extend a full 360 degrees, i.e., the entire circumference of the esophagus. The valve formed by the intussusception is similar to the "gerd standard" open or laparoscopic procedure, a Nissen Fundoplication. However, a full 360 degrees may not be achievable with an endoluminal approach. In that case, a Toupet fundoplication, spanning approximately 270 degrees of the circumference around the esophagus can be performed. The endoluminal procedure thus cannot generally be performed on an arc of approximately 60 degrees, on the back side of the esophagus. In the remaining portion of the esophagus circumference, fasteners can be attached, for example, at 30 degrees intervals.

Figure 5 shows a hypotube 40 with a beveled edge which has been inserted through the fastener delivery device 24 and further advanced so as to penetrate tissue of both the esophageal and gastric walls, 44 and 46 respectively. Hypotube 40 can be, for example, an hypodermic needle cannula, or another type of thin tubing, preferably of stainless steel.

A T-fastener 42 of the type known in the art can be inserted through the hypotube 40 until the distal end of the fastener 42 is deployed on the stomach side of the intussusception. The hypotube 40 is then retracted towards the sheath 24 so that the deployed distal end of the T-fastener engages the gastric wall 46 as the hypotube 40 is retracted, as shown in Figure 6. As shown in Figure 7, the hypotube 40 is further retracted into the sheath 24 until the proximal end of the T-fastener is pulled out of the hypotube 40 by the tension exerted from the distal end of the T-fastener 42. The proximal end of the T-fastener 42 then seats against the inner wall of the esophagus, thereby holding the gastric wall and the esophagus together. The length of the longitudinal center portion of the T-fastener determines the maximum distance between the inner wall of the esophagus and the inner wall of the fundus.

WO 02/28289

PCT/US01/29593

Figures 9-11 illustrate various configurations of T-fasteners which may be used to secure the esophageal and gastric walls. The traditional T-fastener 48 has a simple T-bar at each end. With this fastener, the forces of securing the gastric and esophageal tissue in the post-deformation position are borne by the T-bars at each end of the fastener, which have a small area over which to distribute the forces. This type of T-bar may pull through either the gastric or esophageal wall. Thus, it may be desirable to utilize T-fasteners in conjunction with the present invention which have T-bar configurations with increased area over which the forces of securing the tissue will be distributed. Figure 9 shows a T-fastener with two T-bar bolster at each end. In addition, the area over which the forces of securing tissue are distributed can be increased by, for example, utilizing a T-fastener with three prongs, four prongs, or six prongs. (Shown in Figures 10, 9, and 11 respectively.)

Figure 12 shows an alternative fastener 56 which can be used to secure gastric and esophageal tissue according to the present invention. The fastener 56 has a longitudinal center portion with inflatable balloons 58 at each end. This fastener 56 may be inserted through the gastric and esophageal tissue in the same manner as that described above with respect to T-fastener insertion. Once the fastener 56 is in place, air, water or other material may be introduced into the inflatable ends 58, thereby inflating the ends 58 and securing the gastric and esophageal tissue. The inflatable ends may be spherical or disk-shaped.

In one exemplary embodiment, the balloon can be formed on the distal end of fastener 42, as shown in Figure 12, and can be stored in hypotube 40 during insertion through walls 44, 46. As hypotube 40 is retracted, the balloon can be inflated with a fluid passing through an inflation tube formed within hypotube 40. A similar process can take place to inflate a balloon at the proximal end of fastener 42, before separation from hypotube 40. Seals of known design can be used to maintain both balloons inflated.

Figures 13-14 show yet another alternative fastener 60 which may be used

WO 02/28289

PCT/US01/29593

to secure gastric and esophageal tissue according to the present invention. The fastener 60 is a longitudinal member with deformable portions 62, 64 near the proximal and distal ends, and may preferably be made of polypropylene or other biocompatible durable material.

5 The deformable portions 62, 64 preferably have a mesh-like structure which may be expanded radially by, for example, buckling when the ends of the fastener 60 are compressed toward on another. The fastener 60 is inserted into the gastric and esophageal tissue in the same manner as described above with respect to T-fastener insertion, as shown in Figures 5-7. When the proximal and
10 distal ends are in desired positions within the esophagus and the stomach respectively, the ends are expanded.

 In one exemplary embodiment, the fastener 60 may be formed such that it is normally biased toward the deformed position, as shown in Figure 13b. A fastener 60 of this type can be maintained in the reduced diameter configuration
15 while contained within in the hypotube 40, and would expand due to its natural bias upon release therefrom. The deformable portions 62 and 64 are compressed so as to allow insertion of the fastener through the delivery device 24 and through both gastric and esophageal tissue. The fastener 60 can then be advanced through the hypotube 40 until the distal deformable portion 64 exits the
20 distal end of the hypotube 40, and regains its normally radially expanded position. The hypotube 40 can then be retracted, allowing the proximal deformable portion 62 to expand to its normally radially expanded position. The deformed portions 62 and 64 then act as bolsters which secure the gastric and esophageal tissue in place.

25 Alternatively, a fastener 60 with deformable portions 60 may be formed such that it is normally in the un-deformed position, as shown in Figure 13a. The normally un-deformed fastener would be inserted through the gastric and esophageal tissue in the same manner as described above with respect to the normally deformed embodiment. The normally un-deformed fastener must then

WO 02/28289

PCT/US01/29593

be manipulated into the deformed position shown in Figure 13b after being placed in the desired position spanning the esophageal and stomach tissue. A crimping device, inserted through the lumen of the endoscope, can be used to perform such manipulation. This device may resemble a known mechanism used for inserting rivets. As would be understood by those skilled in the art, any device which may be inserted through the lumen of an endoscope and which can compress the ends of the fastener 60 so as to buckle the deformable portions may be used as the crimping device.

The fastener 60 may also be formed with a needle-like point at its distal end to aid insertion. Such a distal end would enable insertion of the fastener 60 directly through the gastric and esophageal tissue, eliminating the need for the hypotube 40.

As shown in Figure 16, the hypotube 40 previously described with reference to Figures 5-7 can be replaced with an insertion device 100 that deploys a fastener 102. When insertion device 100 is in position across the esophageal and gastric walls 44, 46, as shown in Figure 16a, an actuating wire 104 that extends the length of endoscope 16 is pulled, so that a distal stent 106 is deployed, as seen in Figure 16b. As the insertion device 100 is withdrawn, actuating wire 104 is pulled again as shown in Figure 16c, so that proximal stent 108 is deployed, and the walls 44, 46 are sandwiched between stents 106, 108, as shown in Figure 16d.

In a different embodiment according to the invention, a two-piece fastener comprising a barbed tack 70 and a mating washer 74, as shown in Figure 14, may be employed. The barbed tack 70 consists of a disk portion 71 with a barbed connector 72. The barbed connector 72 can be inserted through the mating washer 74 such that the connector 72 is engaged by the washer 74. Both components 70 and 74 can preferentially be made of a resilient polymeric material.

In one alternative exemplary embodiment of a device according to the

WO 02/28289

PCT/US01/29593

invention, the barbed tack 70 and mating washer 74 may be inserted using a fundoplication device 120, that is described in Figures 17a to 17e. Figure 17a shows a device 120 at the end of a flexible tube 121, that is inserted through esophagus 10 into the patient's stomach 32. An endoscope 16 can also be introduced, to visually monitor the procedure. Once in position, device 120 deploys a pivotable tissue displacing portion 124, shown in Figure 17b, that is moved in position towards the gastric fundus 12.

A gripping portion 128 of device 120 is used to grasp an attachment site 14 at the gastroesophageal junction, as shown in Figure 17c, so that downward movement of device 120 pulls that region of the esophagus 10 into stomach 32. A spike 130 can also be used to facilitate this procedure. Once the esophagus opening is in the proper position, tissue displacement portion 124 is pivoted towards an anvil portion 126 of the device 120, so that fundus 12 is pushed towards the esophagus, forming an intussusception.

When tissue displacement portion 124 reaches anvil portion 126, as shown in Figure 17d, the barbed portion 70 of the fastener, mounted on tissue displacement portion 124, pierces the gastric wall 46 and esophageal wall 44, and is secured to mating washer 74, mounted on anvil portion 126. This procedure results in formation of a flap of tissue 132. As previously discussed for other embodiments according to the invention, this procedure can be repeated at different circumferential locations around the esophagus, to form a valve of desired shape separating stomach 32 from esophagus 10, as shown in Figure 17e.

Finally, a bonding agent can be injected into the tissue of the intussusception, as shown in Figure 4, causing a fibrotic reaction which secures the gastric and esophageal tissue of the fundoplication. Sodium morrhuate, for example, is a known agent that may be injected into the tissue fold formed between the gastric and esophageal tissue, so as to create a fibrotic reaction that adheres the gastric fundus to the esophagus permanently.

WO 02/28289

PCT/US01/29593

Several compounds can be used as bonding agents. For example, among the adhesive compounds, cyanoacrylate can be used, as well as fibrin sealant, muscle adhesive protein, Transforming Growth Factor Beta, Prolamine gel, Gelatin-Resorcinol-Formol glue and Hystoacryl. Among the sclerosant
5 compounds, Morrhuate Sodium, Sodium Tetradecyl Sulfate, Ethanolamine Oleate, aerosol-tale and sterile Bleomycin Sulfate can be used.

When such a bonding agent is used, the fastener need only secure the tissue until the reaction caused by the agent has sufficiently secured the tissue in place. The fastener used may then be made of a biodegradable or bioabsorbable
10 material, or can be removed.

WO 02/28289

PCT/US01/29593

What is claimed is:

1. A method for performing endoluminal fundoplication of a patient's esophagus and stomach, comprising:
forming an intussusception of the esophagus into the stomach by pulling a
5 selected portion of the esophagus into the stomach, and by displacing a fundus
portion of the stomach towards the esophagus;
placing a fastener across the intussusception, said fastener maintaining an
esophageal wall and a gastric wall forming the intussusception adjacent to one
another; and
10 injecting a bonding agent between the esophageal wall and a gastric wall
to bond the intussusception.

2. The method according to claim 1, further comprising removing the fastener
after bonding the intussusception.
15

3. The method according to claim 1, further comprising the preliminary steps
of:
introducing through the esophagus and positioning an endoscope device
adjacent a gastroesophageal junction;
20 extending from the endoscope device a grasping device adapted to grasp
and pull the opening portion of the esophagus; and
extending from the endoscope device a tissue displacement device
adapted to displace the fundus portion of the stomach.

25 4. The method according to claim 1, further comprising:
introducing through the esophagus and positioning a fastener delivery
device adjacent to the intussusception at a desired fastening location;
delivering the fastener from the delivery device to attach the esophageal
wall to the gastric wall.

WO 02/28289

PCT/US01/29593

5. The method according to claim 4, further comprising;
extending a hypotube from the fastener delivery device through the
esophageal wall and the gastric wall forming the intussusception;
deploying a distal end of the fastener to prevent withdrawal of the fastener;
5 withdrawing the hypotube from the intussusception; and
deploying a proximate end of the fastener to maintain the esophageal wall
adjacent to the gastric wall.
6. The method according to claim 4, further comprising repeating the
10 positioning and delivering steps a selected number of times.
7. The method according to claim 6, further comprising successively
positioning the delivery device and delivering the fastener at selected positions
around a circumference of the intussusception.
- 15 8. The method according to claim 5, wherein the deploying steps further
comprise inflating bladders disposed at the distal and at the proximate end of the
fastener.
- 20 9. The method according to claim 5, wherein the deploying steps further
comprise extending deformable portions disposed at the distal and proximate
ends of the fastener.
- 25 10. The method according to claim 1, wherein the injecting step further
comprises injecting at least one of an adhesive and a sclerosant agent.
11. The method according to claim 1, wherein the forming an intussusception
and the placing a fastener steps further comprise:
introducing through the esophagus and placing adjacent a

WO 02/28289

PCT/US01/29593

gastroesophageal junction a fastening device having a gripping portion and a tissue displacing portion;

gripping an opening portion of the esophagus with the gripping portion, and pulling the opening portion into the stomach;

5 moving a fundus portion of the stomach towards the esophagus by pivoting the tissue displacing portion towards an anvil portion of the fastening device, such that the gastric wall and the esophageal wall are between the anvil portion and the pivoted tissue displacing portion;

10 driving a barbed portion of a fastener disposed on the tissue displacing portion through the gastric wall and the esophageal wall; and

securing the barbed portion of the fastener to a mating washer portion of the fastener disposed on the anvil portion.

12. A method for performing endoluminal fundoplication comprising the steps of:

15 inserting an endoscope through a patient's esophagus into the patient's stomach;

inserting a grasping device through the esophagus to a position adjacent the gastroesophageal junction;

20 inserting a tissue displacement device through the esophagus to the position adjacent the gastroesophageal junction;

grasping and moving into the stomach a selected portion of the esophagus with the grasping device, to form an esophageal wall;

25 displacing a fundus portion of the stomach towards the esophageal wall with the tissue displacement device, to form a gastric wall;

inserting a fastening device through the esophagus to a position adjacent the gastroesophageal junction; and

deploying a fastener from the fastening device, to attach the esophageal wall to the gastric wall.

WO 02/28289

PCT/US01/29593

13. The method according to claim 12, further comprising injecting one of an adhesive and a sclerosant agent between the gastric wall and the esophageal wall.
- 5 14. The method according to claim 12, further comprising inserting an overtube over the endoscope, defining a channel for insertion of at least one of the grasping device, tissue displacement device, and fastening device.
15. The method according to claim 12, further comprising rotating the fastening device by a selected rotation, and repeating the deploying step.
- 10 16. The method according to claim 15, wherein the rotating step comprises rotating the fastening device by about 30 degrees.
17. The method according to claim 12, further comprising removing the fastener after bonding of the gastric wall to the esophageal wall.
- 15 18. A device for performing endoluminal fundoplication of a patient's esophagus and stomach, comprising:
a flexible tube having a distal end adapted for insertion in the stomach
20 through the esophagus;
a tissue grasping device disposed at the distal end of the flexible tube, adapted to grasp a selected portion of the esophagus;
a tissue displacement device disposed adjacent the tissue grasping device, adapted to move a fundus portion of the stomach towards the esophagus; and
25 an anvil portion, pivotable relative the tissue displacement portion, wherein the tissue displacement device and the anvil portion releasably carry complementary portions of a fastener, such that said complementary portions are joined when the fundus portion is moved towards the esophagus.

WO 02/28289

PCT/US01/29593

19. The device according to claim 18, further comprising a barbed portion of the flexible tube adapted to move a selected portion of the esophagus.
20. The device according to claim 18, wherein the tissue grasping device comprises a pair of jaws operable independently of the tissue displacement device.
21. The device according to claim 18, wherein the fastener comprises a barbed portion and a mating washer portion.
22. The device according to claim 18, wherein pivoting motion of the tissue displacement device and the anvil portion places the selected portion of the esophagus and the moved fundus portion of the stomach between the tissue placement device and the anvil portion.

(54) Title: METHOD FOR PERFORMING ENDOLUMINAL FUNDOPLICATION AND APPARATUS FOR USE IN THE METHOD

(57) Abstract: A method and device for performing endoluminal fundoplication are described. A device is inserted in the patient's stomach through the esophagus, including an unit adapted to grasp and pull a portion of the gastroesophageal junction into the stomach, and an unit adapted to move a portion of the fundus towards the esophagus. The device also can place fasteners to hold the gastric wall and the esophageal wall secured together, thus forming a valve between esophagus and stomach. An adhesive compound can be used to stabilize the juncture of the two walls.

**METHOD FOR PERFORMING ENDOLUMINAL FUNDOPLICATION AND
APPARATUS FOR USE IN THE METHOD**

Field of the Invention

The present invention relates generally to the art of fundoplicating the stomach to the esophagus. More specifically, the present invention relates to a method for performing such a fundoplication endoluminally, and to an apparatus for securing the fundus to the esophagus.

Background of the Invention

Fundoplication is a surgical procedure which is typically used to treat Gastroesophageal Reflux (GER) condition, a malady often resulting from a deformity of the gastroesophageal junction (GEJ), and/or a dysfunctional lower esophageal sphincter (LES). One symptom commonly associated with GER is regurgitation or reflux of stomach contents into the esophagus. Fundoplication procedures are directed towards manipulating esophageal and gastric tissue so as to form a valve at the GEJ which limits reflux into the esophagus. The valve is formed by manipulation of the esophagus so as to invaginate the stomach, then wrapping the fundus of the stomach around the distal end of the esophagus and securing the stomach in that wrapped position.

The most commonly used fundoplication procedures require abdominal or thoracic incisions through which the abdominal wrapping and securing can be performed. Due to the highly invasive nature of such surgery, complications and morbidity occur in a significant percentage of cases. In addition, these procedures are lengthy, often taking a number of hours to perform, and may leave disfiguring scars where the incisions were made.

Other recently developed fundoplication procedures somewhat limit the necessity of making large surgical incisions by utilizing laparoscopic ports or

WO 02/028289

PCT/US01/29593

percutaneous endoscopic gastrostomy. (See, e.g. United States Patent Nos. 5,403,326, and 5,088,979, the contents of which are hereby incorporated by reference). Although these procedures are less invasive than those involving large abdominal and thoracic incisions, they are invasive nonetheless, and have costs and risks associated with such invasive surgery. For example, general anaesthesia is typically used during these procedures which adds to the expense of these procedures and entails well known risks.

In addition to the complications, risks, and costs associated with the invasive nature of current fundoplication methods, these methods have other problems as well. One such problem is unwrapping of the fundus, also referred to as slippage of the fundal wrap. Slippage frequently occurs with current methods, as they fail to adequately secure the plicated fundus.

Summary of the Invention

The present invention is directed to a method for endoluminal fundoplication in which a flexible endoscope is first used to locate an attachment site at the gastroesophageal junction. A tissue grasping device is then positioned at the distal end of the endoscope, and attached to the body tissue at the located attachment site. Next, a tissue displacement device is positioned at the distal end of the endoscope and used to displace the fundus of the stomach, so as to create an intussusception of the esophagus into the gastric lumen. A fastener delivery device is then positioned adjacent to a first desired fastener delivery location and used to place a first fastener through the tissue which forms the intussusception at the desired fastener delivery location. The first fastener secures a first portion of the gastric fundus to the esophagus. The fastener delivery device is then used to place additional fasteners at a plurality of additional desired fastener locations, thus securing the gastric fundus around the esophagus. In one exemplary embodiment, the fastener delivery device, the tissue grasping device, and the tissue displacement device can be incorporated into a single unit.

WO 02/028289

PCT/US01/29593

Finally, an injection device is positioned at the distal end of the endoscope and used to inject a bonding agent into the tissue which forms the intussusception. For example, the bonding agent can be an agent for fibrotic fixation or adhesion.

In one embodiment, the invention is a method for performing endoluminal fundoplication of a patient's esophagus and stomach, having the steps of forming an intussusception of the esophagus into the stomach by pulling a selected portion of the esophagus into the stomach, and by displacing a fundus portion of the stomach towards the esophagus, placing a fastener across the intussusception, said fastener maintaining an esophageal wall and a gastric wall forming the intussusception adjacent to one another, and injecting a bonding agent between the esophageal wall and a gastric wall to bond the intussusception.

In another embodiment, the invention is a device for performing endoluminal fundoplication of a patient's esophagus and stomach, comprising a flexible tube having a distal end adapted for insertion in the stomach through the esophagus, a tissue grasping device disposed at the distal end of the flexible tube, adapted to grasp a selected portion of the esophagus, a tissue displacement device disposed adjacent the tissue grasping device, adapted to move a fundus portion of the stomach towards the esophagus and an anvil portion, pivotable relative the tissue displacement portion, wherein the tissue displacement device and the anvil portion releasably carry complementary portions of a fastener, such that said complementary portions are joined when the fundus portion is moved towards the esophagus.

Brief Description of the Drawings

The invention will be more readily understood through the following detailed description, with reference to the accompanying drawings, in which:

WO 02/028289

PCT/US01/29593

Figures 1 through 4 illustrate the method of endoluminal fundoplication according to one embodiment of the present invention;

Figure 1 shows a cross-sectional view of the distal end of an esophagus and the upper gastric wall, with an endoscope inserted through the esophagus and into the gastric lumen, and a tissue grasping device attached to a site on the gastroesophageal junction;

Figure 2 shows the cross-sectional view as in Figure 1 and, in addition, shows a tissue displacement device and the gastric fundus displaced so as to form an intussusception of the esophagus into the gastric lumen;

Figure 3 shows the cross-sectional view as in Figure 2 and, in addition, shows a tissue fastener device and a fastener placed through the intussusception;

Figure 4 shows a cross-sectional view of the distal end of an esophagus and the upper gastric wall, with an endoscope inserted through the esophagus and into the gastric lumen, two fasteners placed within the intussusception, and an injection device inserted into the intussusception;

Figure 5 shows a cross-sectional view of an intussusception of the esophagus into the gastric lumen with a hypotube inserted through both the esophageal and gastric walls;

Figure 6 shows the cross-sectional view as in Figure 5, with the distal end of a T-fastener deployed;

Figure 7 shows the cross-sectional view as in Figure 5, with the hypotube retracted from within the body tissue, and with both the proximal and distal ends

Figures 16a, 16b, 16c and 16d are side views showing the deployment device for a fastener according to another embodiment of the present invention; and

Figs 17a to 17e are diagrams showing the steps of operation of a different embodiment of a system according to the present invention, which includes a fundoplication device.

Detailed Description of the Invention

The method of the present invention can be performed, for example, using a flexible endoscope 16, which is preferably equipped with a tissue grasping device 18 (shown in Figure 1), a tissue displacement device 22 (shown in Figure 2), a fastener delivery device 24 (shown in Figure 3), and an injection device 28 (shown in Figure 4). The endoscope preferably has one or more oversheath channels through which various devices may pass. For example, the endoscope may be equipped with a tissue displacement device which passes through the lumen of an oversheath channel, and can be controllably extended past the distal end of the endoscope by the endoscopist. In addition, the endoscope preferably has a second oversheath channel through which a fastener delivery device passes and an injection device operable at its distal end. The endoscopist can operate the endoscope, including the tissue grasping device, tissue displacement device, fastener delivery device, and injection device from the proximal end of the endoscope.

Different types of endoscopes can be used for this procedure. If necessary, an overtube with one or more passages can be slipped over the endoscope to the location of the fundoplication, to facilitate insertion of additional tools. For example, Figure 15a shows an endoscope 16 having several channels 15 that provide irrigation, suction, illumination and video feedback. This exemplary endoscope 16 includes one working channel A. To facilitate insertion of additional tools, an overtube 20 can be used, forming a sheath that defines

WO 02/028289

PCT/US01/29593

additional working channels E and F that reach the distal end of endoscope 16. Similarly, Figure 15b shows an endoscope 16' having two working channels A and B. In this case, an overtube 20' only has to provide a passage for one additional working channel F. In this discussion, an "endoscopic device" is used to generally indicate an endoscope and, when required, an overtube defining additional working channels.

In one embodiment, the patient's stomach is insufflated to facilitate the operation. The patient can also be sedated with an intravenous anesthesia injection during the procedure.

Using the present method, the flexible endoscope 16 is first inserted into the patient's mouth, passed through the esophagus 10 and into the stomach, as shown in Figure 1. The inserted endoscope 16 is then used to locate an attachment site 14 at the gastroesophageal junction. The endoscopist, or other practitioner performing the procedure, can locate the site by viewing the GEJ through the endoscope. These methods for endoscopically locating target sites are well known and widely used in the art.

The tissue grasping device 18 can be positioned at the located attachment site 14, and engaged so as to grasp and hold that tissue, as shown in Figure 1. The tissue grasping device 18 passes through a lumen of the endoscope 16 and is operable from the proximal end of the endoscope 16 by the practitioner. Preferably, the practitioner can control the engaging/disengaging of the device 18, as well as the tension which the device 18 applies to the engaged tissue. This tension can be controlled by extending the device 18 past or retracting the device 18 towards the distal end of the endoscope 16. The means with which the tissue grasping device 18 engages, or grasps, and holds the tissue can consist of a hook, clamp, grasper, a combination thereof, or the like, as is known in the art.

After tissue at the GEJ has been grasped, the tissue displacement device 22 is used to displace the gastric fundus 12 so as to effectively create an intussusception 30 of the esophagus 10 into the stomach 32, as shown in Figure

WO 02/028289

PCT/US01/29593

2. The tissue displacement device 22 passes through a lumen of an overtube 20 which surrounds the endoscope 16, and can be pushed or rotated to a position distal to the distal tip of the endoscope 16. The device 22 preferably comprises a spherical tip 23 located at the distal end of a stiff cable or Nitinol band. The practitioner can operate the tissue displacement device 22, for example, by pushing and rotating it into position against the gastric fundus.

Once in position against the gastric fundus 12, the tissue displacement device 22 is further pushed and rotated so as to press against and reposition the gastric fundus 12. Simultaneously, the tissue grasping device 18 holds the tissue at the attachment site 14, applying a force which opposes force supplied by the tissue displacement device 22. The net effect of these counteracting forces is that the gastric fundus 12 is brought in closer proximity to the esophagus, which makes the angle of His, identified at reference numeral 34, more acute. The displacement of the gastric fundus 12 creates a tissue flap 30, which is effectively an intussusception of the esophagus 10 into the stomach 32. In one preferred embodiment, the flaps of tissue can have an approximate length between 1 and 3 cm.

In a preferred embodiment, the steps of pulling the tissue with the tissue grasping device 18 and displacing the fundus with the tissue displacement device 22 are repeated at several positions around the circumference of the intussusception. For example, the procedure can be performed at four to twelve equidistant locations around the circumference of the esophagus.

The reduction in the angle of His 34 and formation of an intussusception 30 reduces the degree to which stomach contents can reflux into the esophagus 10. A valve is essentially built between the stomach and the esophagus. As gases build up in the gastric lumen 32 and, more specifically, in the gastric fundus 12, pressure is brought to bear on the wrapped portion of the esophagus 10, closing it off from the stomach. In addition, stomach contents move around within the gastric lumen 32 due to contraction of the stomach muscles, and body

WO 02/028289

PCT/US01/29593

movement in general. The intussusception 30 alleviates GER by creating a valve like barrier which stomach contents must pass through in order to reach the esophagus 10.

The intussuscepted esophagus 30 is then fastened to the wall of the gastric fundus 12 to fix the arrangement. The fastener delivery device 24 is used to insert fasteners 26 within the intussusception 30 to hold the gastric and esophageal tissue in place. Since a number of nerves and blood vessels typically run through the tissue being manipulated, the practitioner should, before inserting the fasteners 26, locate the nerves and blood vessels, so as not to damage or sever them. In particular, the practitioner should locate the Vagus nerve bundle which runs alongside the esophagus, the aorta, and the various gastric blood vessels. Numerous methods for locating such anatomical features are well known in the art, including use of ultrasound, fluoroscopy and x-ray.

Once the aforementioned features are located, the practitioner loads a fastener 26 into the fastener delivery device 24 and inserts the device 24 through a second sheath channel 25 until the operating end of the delivery device 24 is positioned at a desired fastener insertion site. The device 24 is then used to place a fastener at a desired site, as shown in Figure 3. Fasteners 26 are preferably inserted through the intussusception at 1 cm and 2.5 cm above the tip 14 of the newly-formed tissue flap 30, which extends into the gastric lumen 32. The fasteners 26 can be inserted also at other locations along the length of the tissue flap, which in the preferred case has a length of between about 1 and 3 cm.

The fastener delivery device 24 can be rotated within the esophagus and gastric lumen so as to insert fasteners around the entire circumference of the esophagus. Preferably, fasteners are inserted at locations approximately 30° apart. For example, from an initial insertion site, the device 24 may be rotated in one direction, inserting fasteners at 30°, 60°, 120°, and 180° from the initial site. The device 24 is then returned to the initial insertion site and rotated in the

WO 02/028289

PCT/US01/29593

opposite direction, again inserting fasteners at, for example, 30° intervals, until the entire circumference of the intussusception has been fastened.

Preferably, the intussusception should extend a full 360 degrees, i.e., the entire circumference of the esophagus. The valve formed by the intussusception is similar to the "gerd standard" open or laparoscopic procedure, a Nissen Fundoplication. However, a full 360 degrees may not be achievable with an endoluminal approach. In that case, a Toupet fundoplication, spanning approximately 270 degrees of the circumference around the esophagus can be performed. The endoluminal procedure thus cannot generally be performed on an arc of approximately 60 degrees, on the back side of the esophagus. In the remaining portion of the esophagus circumference, fasteners can be attached, for example, at 30 degrees intervals.

Figure 5 shows a hypotube 40 with a beveled edge which has been inserted through the fastener delivery device 24 and further advanced so as to penetrate tissue of both the esophageal and gastric walls, 44 and 46 respectively. Hypotube 40 can be, for example, an hypodermic needle cannula, or another type of thin tubing, preferably of stainless steel.

A T-fastener 42 of the type known in the art can be inserted through the hypotube 40 until the distal end of the fastener 42 is deployed on the stomach side of the intussusception. The hypotube 40 is then retracted towards the sheath 24 so that the deployed distal end of the T-fastener engages the gastric wall 46 as the hypotube 40 is retracted, as shown in Figure 6. As shown in Figure 7, the hypotube 40 is further retracted into the sheath 24 until the proximal end of the T-fastener is pulled out of the hypotube 40 by the tension exerted from the distal end of the T-fastener 42. The proximal end of the T-fastener 42 then seats against the inner wall of the esophagus, thereby holding the gastric wall and the esophagus together. The length of the longitudinal center portion of the T-fastener determines the maximum distance between the inner wall of the esophagus and the inner wall of the fundus.

WO 02/028289

PCT/US01/29593

Figures 9-11 illustrate various configurations of T-fasteners which may be used to secure the esophageal and gastric walls. The traditional T-fastener 48 has a simple T-bar at each end. With this fastener, the forces of securing the gastric and esophageal tissue in the post-deformation position are borne by the T-bars at each end of the fastener, which have a small area over which to distribute the forces. This type of T-bar may pull through either the gastric or esophageal wall. Thus, it may be desirable to utilize T-fasteners in conjunction with the present invention which have T-bar configurations with increased area over which the forces of securing the tissue will be distributed. Figure 9 shows a T-fastener with two T-bar bolster at each end. In addition, the area over which the forces of securing tissue are distributed can be increased by, for example, utilizing a T-fastener with three prongs, four prongs, or six prongs. (Shown in Figures 10, 9, and 11 respectively.)

Figure 12 shows an alternative fastener 56 which can be used to secure gastric and esophageal tissue according to the present invention. The fastener 56 has a longitudinal center portion with inflatable balloons 58 at each end. This fastener 56 may be inserted through the gastric and esophageal tissue in the same manner as that described above with respect to T-fastener insertion. Once the fastener 56 is in place, air, water or other material may be introduced into the inflatable ends 58, thereby inflating the ends 58 and securing the gastric and esophageal tissue. The inflatable ends may be spherical or disk-shaped.

In one exemplary embodiment, the balloon can be formed on the distal end of fastener 42, as shown in Figure 12, and can be stored in hypotube 40 during insertion through walls 44, 46. As hypotube 40 is retracted, the balloon can be inflated with a fluid passing through an inflation tube formed within hypotube 40. A similar process can take place to inflate a balloon at the proximal end of fastener 42, before separation from hypotube 40. Seals of known design can be used to maintain both balloons inflated.

Figures 13-14 show yet another alternative fastener 60 which may be used

WO 02/028289

PCT/US01/29593

to secure gastric and esophageal tissue according to the present invention. The fastener 60 is a longitudinal member with deformable portions 62, 64 near the proximal and distal ends, and may preferably be made of polypropylene or other biocompatible durable material.

The deformable portions 62, 64 preferably have a mesh-like structure which may be expanded radially by, for example, buckling when the ends of the fastener 60 are compressed toward on another. The fastener 60 is inserted into the gastric and esophageal tissue in the same manner as described above with respect to T-fastener insertion, as shown in Figures 5-7. When the proximal and distal ends are in desired positions within the esophagus and the stomach respectively, the ends are expanded.

In one exemplary embodiment, the fastener 60 may be formed such that it is normally biased toward the deformed position, as shown in Figure 13b. A fastener 60 of this type can be maintained in the reduced diameter configuration while contained within in the hypotube 40, and would expand due to its natural bias upon release therefrom. The deformable portions 62 and 64 are compressed so as to allow insertion of the fastener through the delivery device 24 and through both gastric and esophageal tissue. The fastener 60 can then be advanced through the hypotube 40 until the distal deformable portion 64 exits the distal end of the hypotube 40, and regains its normally radially expanded position. The hypotube 40 can then be retracted, allowing the proximal deformable portion 62 to expand to its normally radially expanded position. The deformed portions 62 and 64 then act as bolsters which secure the gastric and esophageal tissue in place.

Alternatively, a fastener 60 with deformable portions 60 may be formed such that it is normally in the un-deformed position, as shown in Figure 13a. The normally un-deformed fastener would be inserted through the gastric and esophageal tissue in the same manner as described above with respect to the normally deformed embodiment. The normally un-deformed fastener must then

WO 02/028289

PCT/US01/29593

be manipulated into the deformed position shown in Figure 13b after being placed in the desired position spanning the esophageal and stomach tissue. A crimping device, inserted through the lumen of the endoscope, can be used to perform such manipulation. This device may resemble a known mechanism used for inserting rivets. As would be understood by those skilled in the art, any device which may be inserted through the lumen of an endoscope and which can compress the ends of the fastener 60 so as to buckle the deformable portions may be used as the crimping device.

The fastener 60 may also be formed with a needle-like point at its distal end to aid insertion. Such a distal end would enable insertion of the fastener 60 directly through the gastric and esophageal tissue, eliminating the need for the hypotube 40.

As shown in Figure 16, the hypotube 40 previously described with reference to Figures 5-7 can be replaced with an insertion device 100 that deploys a fastener 102. When insertion device 100 is in position across the esophageal and gastric walls 44, 46, as shown in Figure 16a, an actuating wire 104 that extends the length of endoscope 16 is pulled, so that a distal stent 106 is deployed, as seen in Figure 16b. As the insertion device 100 is withdrawn, actuating wire 104 is pulled again as shown in Figure 16c, so that proximal stent 108 is deployed, and the walls 44, 46 are sandwiched between stents 106, 108, as shown in Figure 16d.

In a different embodiment according to the invention, a two-piece fastener comprising a barbed tack 70 and a mating washer 74, as shown in Figure 14, may be employed. The barbed tack 70 consists of a disk portion 71 with a barbed connector 72. The barbed connector 72 can be inserted through the mating washer 74 such that the connector 72 is engaged by the washer 74. Both components 70 and 74 can preferentially be made of a resilient polymeric material.

In one alternative exemplary embodiment of a device according to the

WO 02/028289

PCT/US01/29593

invention, the barbed tack 70 and mating washer 74 may be inserted using a fundoplication device 120, that is described in Figures 17a to 17e. Figure 17a shows a device 120 at the end of a flexible tube 121, that is inserted through esophagus 10 into the patient's stomach 32. An endoscope 16 can also be introduced, to visually monitor the procedure. Once in position, device 120 deploys a pivotable tissue displacing portion 124, shown in Figure 17b, that is moved in position towards the gastric fundus 12.

A gripping portion 128 of device 120 is used to grasp an attachment site 14 at the gastroesophageal junction, as shown in Figure 17c, so that downward movement of device 120 pulls that region of the esophagus 10 into stomach 32. A spike 130 can also be used to facilitate this procedure. Once the esophagus opening is in the proper position, tissue displacement portion 124 is pivoted towards an anvil portion 126 of the device 120, so that fundus 12 is pushed towards the esophagus, forming an intussusception.

When tissue displacement portion 124 reaches anvil portion 126, as shown in Figure 17d, the barbed portion 70 of the fastener, mounted on tissue displacement portion 124, pierces the gastric wall 46 and esophageal wall 44, and is secured to mating washer 74, mounted on anvil portion 126. This procedure results in formation of a flap of tissue 132. As previously discussed for other embodiments according to the invention, this procedure can be repeated at different circumferential locations around the esophagus, to form a valve of desired shape separating stomach 32 from esophagus 10, as shown in Figure 17e.

Finally, a bonding agent can be injected into the tissue of the intussusception, as shown in Figure 4, causing a fibrotic reaction which secures the gastric and esophageal tissue of the fundoplication. Sodium morrhuate, for example, is a known agent that may be injected into the tissue fold formed between the gastric and esophageal tissue, so as to create a fibrotic reaction that adheres the gastric fundus to the esophagus permanently.

WO 02/028289

PCT/US01/29593

Several compounds can be used as bonding agents. For example, among the adhesive compounds, cyanoacrylate can be used, as well as fibrin sealant, muscle adhesive protein, Transforming Growth Factor Beta, Prolamine gel, Gelatin-Resorcinol-Formol glue and Hystoacryl. Among the sclerosant compounds, Morrhuate Sodium, Sodium Tetradecyl Sulfate, Ethanolamine Oleate, aerosol-tale and sterile Bleomycin Sulfate can be used.

When such a bonding agent is used, the fastener need only secure the tissue until the reaction caused by the agent has sufficiently secured the tissue in place. The fastener used may then be made of a biodegradable or bioabsorbable material, or can be removed.

WO 02/028289

PCT/US01/29593

What is claimed is:

1. A method for performing endoluminal fundoplication of a patient's esophagus and stomach, comprising:
 - forming an intussusception of the esophagus into the stomach by pulling a selected portion of the esophagus into the stomach, and by displacing a fundus portion of the stomach towards the esophagus;
 - placing a fastener across the intussusception, said fastener maintaining an esophageal wall and a gastric wall forming the intussusception adjacent to one another; and
 - injecting a bonding agent between the esophageal wall and a gastric wall to bond the intussusception.
2. The method according to claim 1, further comprising removing the fastener after bonding the intussusception.
3. The method according to claim 1, further comprising the preliminary steps of:
 - introducing through the esophagus and positioning an endoscope device adjacent a gastroesophageal junction;
 - extending from the endoscope device a grasping device adapted to grasp and pull the opening portion of the esophagus; and
 - extending from the endoscope device a tissue displacement device adapted to displace the fundus portion of the stomach.
4. The method according to claim 1, further comprising:
 - introducing through the esophagus and positioning a fastener delivery device adjacent to the intussusception at a desired fastening location;
 - delivering the fastener from the delivery device to attach the esophageal wall to the gastric wall.

WO 02/028289

PCT/US01/29593

5. The method according to claim 4, further comprising;
extending a hypotube from the fastener delivery device through the
esophageal wall and the gastric wall forming the intussusception;
deploying a distal end of the fastener to prevent withdrawal of the fastener;
withdrawing the hypotube from the intussusception; and
deploying a proximate end of the fastener to maintain the esophageal wall
adjacent to the gastric wall.
6. The method according to claim 4, further comprising repeating the
positioning and delivering steps a selected number of times.
7. The method according to claim 6, further comprising successively
positioning the delivery device and delivering the fastener at selected positions
around a circumference of the intussusception.
8. The method according to claim 5, wherein the deploying steps further
comprise inflating bladders disposed at the distal and at the proximate end of the
fastener.
9. The method according to claim 5, wherein the deploying steps further
comprise extending deformable portions disposed at the distal and proximate
ends of the fastener.
10. The method according to claim 1, wherein the injecting step further
comprises injecting at least one of an adhesive and a sclerosant agent.
11. The method according to claim 1, wherein the forming an intussusception
and the placing a fastener steps further comprise:
introducing through the esophagus and placing adjacent a

WO 02/028289

PCT/US01/29593

gastroesophageal junction a fastening device having a gripping portion and a tissue displacing portion;

gripping an opening portion of the esophagus with the gripping portion, and pulling the opening portion into the stomach;

moving a fundus portion of the stomach towards the esophagus by pivoting the tissue displacing portion towards an anvil portion of the fastening device, such that the gastric wall and the esophageal wall are between the anvil portion and the pivoted tissue displacing portion;

driving a barbed portion of a fastener disposed on the tissue displacing portion through the gastric wall and the esophageal wall; and

securing the barbed portion of the fastener to a mating washer portion of the fastener disposed on the anvil portion.

12. A method for performing endoluminal fundoplication comprising the steps of:

inserting an endoscope through a patient's esophagus into the patient's stomach;

inserting a grasping device through the esophagus to a position adjacent the gastroesophageal junction;

inserting a tissue displacement device through the esophagus to the position adjacent the gastroesophageal junction;

grasping and moving into the stomach a selected portion of the esophagus with the grasping device, to form an esophageal wall;

displacing a fundus portion of the stomach towards the esophageal wall with the tissue displacement device, to form a gastric wall;

inserting a fastening device through the esophagus to a position adjacent the gastroesophageal junction; and

deploying a fastener from the fastening device, to attach the esophageal wall to the gastric wall.

WO 02/028289

PCT/US01/29593

13. The method according to claim 12, further comprising injecting one of an adhesive and a sclerosant agent between the gastric wall and the esophageal wall.

14. The method according to claim 12, further comprising inserting an overtube over the endoscope, defining a channel for insertion of at least one of the grasping device, tissue displacement device, and fastening device.

15. The method according to claim 12, further comprising rotating the fastening device by a selected rotation, and repeating the deploying step.

16. The method according to claim 15, wherein the rotating step comprises rotating the fastening device by about 30 degrees.

17. The method according to claim 12, further comprising removing the fastener after bonding of the gastric wall to the esophageal wall.

18. A device for performing endoluminal fundoplication of a patient's esophagus and stomach, comprising:

- a flexible tube having a distal end adapted for insertion in the stomach through the esophagus;

- a tissue grasping device disposed at the distal end of the flexible tube, adapted to grasp a selected portion of the esophagus;

- a tissue displacement device disposed adjacent the tissue grasping device, adapted to move a fundus portion of the stomach towards the esophagus; and

- an anvil portion, pivotable relative the tissue displacement portion, wherein the tissue displacement device and the anvil portion releasably carry complementary portions of a fastener, such that said complementary portions are joined when the fundus portion is moved towards the esophagus.

WO 02/028289

PCT/US01/29593

19. The device according to claim 18, further comprising a barbed portion of the flexible tube adapted to move a selected portion of the esophagus.

20. The device according to claim 18, wherein the tissue grasping device comprises a pair of jaws operable independently of the tissue displacement device.

21. The device according to claim 18, wherein the fastener comprises a barbed portion and a mating washer portion.

22. The device according to claim 18, wherein pivoting motion of the tissue displacement device and the anvil portion places the selected portion of the esophagus and the moved fundus portion of the stomach between the tissue placement device and the anvil portion.
